>called GEMFILE.GEM and then crashes. I get 2 bombs and it does not come
>back from that command.

I had similar problems too. I noticed that every program writing metafiles
i know of uses the screen too. This lead me to opnvwk the screen and
additionally opnwk the meta device. And this worked for me.
I believe it is not even necessary to keep the virtual device open.
May be that some components of gdos are initialized in that step, but who
knows ?
I posted this 2 months ago but there was no reaction.
Hope this helps...

```
Just send the disk... I have PD commprograms (including vt100 IBM char set
emulator, Xmodem, Ymodem. Zmodem, BBS software, off-line mail reader).

Public Domain Communication Disk from ABK-BBS, The Atari BBS in Norway
========================================================================
All programs on this disk are free, but if you want to support me and
further developement of MiniTerm & MiniBBS you can become a registred
user. You will then receive update- and new programs information.
------------------------------------------------------------------------
Send 100 NKr, $15, DM25, 10 pounds or 30 guilders by cheque or to
norwegian postgiro account 0537 6846174 (see your local post office for
a transfer card, "Service des cheques postaux, Avis de versement VP1").
Payable to: Lars-Erik 0sterud, 0kriveien 39, N-1349 Rykkinn, Norway.
========================================================================
MINITERM.ACC The very best communication-program for the Atari ST !!
Supports full VT100-emulation and full IBM characterset
with all graphics. Has Xmodem, Ymodem and Zmodem file-
transfer possibilities and fast screen-dump to printer.
If you don't like ACCs just rename it to MINITERM.PRG.
--------------------------------------------------------
MINITERM.INF All settings (dialing dir, f-keys, external programs)
is in the file MINITERM.INF. Use a normal text-editor
SETUP932.PRG or the Public Domain program SETUP932 to edit them.
To use reversed colors add an R after Color1 setting.
--------------------------------------------------------
PRNTFKEY.TOS Prints out the dialing-dir and the f-key macros so
that you can paste them above your function keys.
------------------------------------------------------------------------
MINIBBS\ Public Domain BBS-system - see READ.ME file in folder.
------------------------------------------------------------------------
READMAIL\ Off-Line Mail-reader for MBBS & MiniBBS. You can read
and answer mail Off-Line - see READ.ME file in folder.
------------------------------------------------------------------------
EMULATOR\ Programs to emulate colors,mono,520 - see own READ.ME.
------------------------------------------------------------------------
AUTO\
TIMEDRV3.PRG Small program that will display the time and active
drive/direction in the screen's upper right corner
QUICKSTM.PRG Mono demo version of Quick-ST 1.6 (>1100% faster text)
QUICKSTC.PRG Colr demo version of Quick-ST 1.6 (>1100% faster text)
PROTECT4.PRG Works in the background and checks for boot-viruses
NORKEY5.PRG Norwegian keyboard driver (for norwegian use only :-)
OPPSTAR7.PRG Key-click off, Epson/IBM, ACC's ?, Sets date and time
------------------------------------------------------------------------
```

PACK.TOS Compresses program-files to shorter program-files !
ARC.TTP The newest version of ARC (uses .ARC-files)
LHARC.TTP Packs better than ARC, ZIP and ZOO (uses .LZH-files)
ARC2LZH.TTP Converts .ARC-files to .LZH-files (saves a lot of work)
ARCSHELL.PRG GEM-shell to make use of ARC, LHARC and ZOO very easy
ARCSHELL.INF Configuration for ARCSHELL (edit with a text-editor)

RZ.TTP Zmodem-receiver for MiniTerm, MiniBBS and ReadMail
SZ.TTP Zmodem-sender for MiniTerm and MiniBBS

PROTECT3.TOS Small utility to kill boot-sector viruses and protect
disk against new boot-sector viruses. This disk has
an info-message in the boot-sector - It's NOT a virus

MINIVIEW.TTP Small text-file viewer to replace SHOW-file option
DESKTOP.INF View this file to see how to install MINIVIEW.TTP

NTPLAY.TTP Small program to play NoiseTracker files from Amiga
---
MYSELF.TXT If you want to know more about me - read this text !

3. KA9Q and Mail/SMTP

Newsgroup: comp.sys.atari.st
Date: 1990-06-01 08:05:01 UTC
From: slarti@tharr.UUCP
Message-ID: <766@tharr.UUCP>
Source record: 240573

Hi,
I'm currently expermenting with the SLIP feature of the KA9Q package,
on both PCs and STs, the PCs having hard disks, the ST running on floppies
only. FTP works fine between the two machines, but when I send mail from
the PC to the ST, it fouls up. The "From:" line is dumped into an improperly
named and placed file, and the remainder of the message is output to the
screen. I notice that the ST implementation does not include any sort of
mail handler -- is this because it is not fully supported yet, or have
I got something wrong in my setup to cause the error described above ?
If I set up mail by hand on the ST and send to the PC it works fine.

Any help would be much appreciated.

Ta.

Dunc

I'm tempted to flippantly say that the TT is whatever the Atari paparazzi need it to be, to sustain the One True Faith. Actually, only Atari knows exactly what a TT will be, and perhaps even they don't know yet. Prototypes have been shopped around to developers & magazines, but it's far from clear that those bear any resemblance to whatever will finally get dropped off at your Local Authorized Atari Dealers (wherever they might be). START magazine had a look at such a prototype a few months ago, and babbled a bit about the guts of it. Sounds to me like the 520ST of the 90's (basically a closed box, w/ twiddled TOS, w/ 16 MHz 68030 & a few graphics tweaks); read that as you may.

In short: you want speculation, we got it aplenty. Facts, those require patience. And Faith.

No knocks on Spectre (I don't own one), but it doesn't seem wise to base a business on something "nearly compatible". Personal use, yes. Business internal use, perhaps. But if by "their publishing" you mean anything that goes out the door, I'd suggest they probably shouldn't go the emulator route. Or at they very least, that they thoroughly test the software they want to run, on the Spectre, before jumping into it in a big way.

Again, nothing against ST's or Spectres or the combination; but if it were my business, I'd be pretty conservative where my workaday bottom-line equipment was concerned. (On the other hand, what publishing software do they want? Perhaps there's something comparable on the native ST side? I hear good things about Calamus...)

Ahh, the first Hard Dates! Are these Official Atari Dates? In other words, I can mark "TT freely available somewhere in Europe" on August 31st (I'm being generous) of my calendar, and when August 31st rolls around I won't hear, "Awaiting FCC approval", "They're on the boat from Taiwan", "Shortage of gloobenfloogle chips", or any other sentences prefaced with "Sorry"? Household members throughout Europe (or Holland, at any rate) really will be saving their desktops on shiny new '030 Atari machines come September?

> First machines ofcourse are handmade models. Regular
>shipments are massproduction.

This sounds SOOOOOO familiar (anyone remember what the original ST introduction was like?). Perhaps we should have a contest: Who can come closest to guessing the number of mother-board revisions the TT will undergo within a year of its introduction?

Okay, it's Friday & sunny; I should lighten up...

> Price is not coming down before fall.

So, how much? (We geocentric Americans would like a dollar figure, naturally. Or, at least a scale-factor from your currency... :-)

9. Arcgsh (Archiver GEM Shell) Version 3.0 is out

Newsgroup: comp.sys.atari.st
Date: 1990-06-01 13:57:52 UTC
From: klute@heike.informatik.uni-dortmund.de
Message-ID: <2216@laura.UUCP>
Source record: 240575
Cross-posted to: comp.sys.atari.st,dnet.atari,unido.atari,sub.sys.st

I just mailed Arcgsh V3.0 to Steven Grimm, the moderator of comp.binaries.atari.st. So it will show up in that newsgroup really soon now. To let you know what Arcgsh offers here is an extract from the README file:

Arcgsh is a program that eases the calling of the well-known archivers Zoo, Arc, LHarc and Shar. Furthermore the programs Uud and Uue are supported to let you decode resp. encode binary files for handling with e-mail. You can use your favorite file viewer and your favorite editor from Arcgsh without any need to leave the program.

With Arcgsh it is no longer neccessary to start a command-line-shell, "cd" to the directory where your archive file is (or should be created), remember the various archiver options (each archiver has it's own set of options), type them in and finally start the program. With Arcgsh you can handle everything with GEM objects: Dialog boxes let you select program options, and filenames are comfortably selected using the GEM file selector box.

Arcgsh serves especially well for uudecoding and unarcing any stuff received from computer networks. The programs ZOO.TTP, ARC.TTP, LHARC.TTP, UUD.TTP, UUE.TTP, and SHAR.TTP are not part of the Arcgsh distribution. You have to get them elsewhere.

New in this version:
- LHarc is supported.
- Arc version 6.02 is supported. (The former version was 5.21.)
- Again a new and very different configuration file format. You cannot use your old configuration file any more. Please create a new one! (A conversion aid from old to new format is not given.)
- Documentation is in LaTeX format now.
- A huge bunch of internal code revirement has been done. Some of it you will notice: TOS 1.4 support, the file selection handler (a la Zoo dialog box) for all programs (except Uud and Uue).

10. DTP for the ST

Newsgroup: comp.sys.atari.st
Date: 1990-06-01 14:16:15 UTC
From: jalkio@cc.helsinki.fi
Message-ID: <2613.266678af@cc.helsinki.fi>
Source record: 240574

I would like to get some info on low-cost DTP programs for the ST (that is, everything else than Calamus). I have worked with the Timeworks, but I would like to try something else, too.

Is Pagestream any good? How about Publishing Partner or perhaps the new version of Fleet Street Editor? I would be really glad to get some info, because I have noticed some restrictions in the Timeworks.

Jouni

I'd like to have someone at C= confirm this. The 3000/25 is a 68030 machine with a 68882 and resolutions up to 1280x800 - that ISN`T 500 graphics. The 500 will be able to do it later, but for $3039 for a 2 meg A3000 with a 25MHz 68030/68882 under the educational discount, it's hard to beat.

12. Turbo C 2.0

Newsgroup: comp.sys.atari.st
Date: 1990-06-01 14:39:35 UTC
From: cjy@uafhcx.uucp
Message-ID: <4696@uafhp.uark.edu>
Source record: 240578

I have some friends that are taking a trip to Europe this month, and I am hoping to have them buy a copy of Turbo C 2.0 with the debugger and assembler for my ST while they are there. Could someone please mail me the name and address of a store in either Munich or, preferably, Vienna where they could purchase it for me. As they are not computer types, a written name of what they should ask for would be very helpful. Also, an approximate price would be nice. Thanks in advance for providing me with this information.

13. HP Deskjet - Refillable cartridges, Special Labels

Newsgroup: comp.sys.atari.st
Date: 1990-06-01 14:51:26 UTC
From: rcd@cbnewsj.att.com
Message-ID: <1990Jun1.145126.3392@cbnewsj.att.com>
Source record: 240571

I came across the following two items in comp.sys.mac, which I thought
would be of interest to HP Deskjet users in this newsgroup.

ITEM 1 - Refillable, waterfast(?) cartridges!

Steve Cook (cook@hpmtlx.HP.COM) writes

A company in Waltham, Graphic Utilities, has started selling a
refillable Deskjet cartridge for about $15.00. They claim their
ink has 90% retention whereas HP's only has 5%. I haven't tried
it yet, but it sounds promising. They can be reached at
1-800-669-4723. I know HP is working on an ink which is less
water soluble.

ITEM 2 - Special Labels

Stephen Marcus (marcus@cbnewsc.att.com) writes

I called HP to ask them why you can't use laser printer labels
in a DeskJet/Writer. Sure enough, standard labels tend to come
off their backing in the paperfeed mechanism. However:

HP now makes special labels for the DeskJet/Writer -
92296 labels, call HP at 1-800 538 8787 for order info.
These labels have a special glue which makes the backing
adhere better, and not come off in the paper path.

Also (this information given by HP support), Avery makes labels
for the DeskJet/DeskWriter: they MUST have a gold starburst on
the box saying "FOR DESKJET". I checked with the local EggHead,
and they already had mailing labels, but not yet the ones for
floppy disk labels. You can also order direct from Avery:
(818) 969 3311 x3369.

Perhaps someone will try these products and share their experiences
with us. (Note, I have no affiliation with either company.)

From: windy@truth.informatik.rwth-aachen.de
Message-ID: <2945@rwthinf.UUCP>
Source record: 240590

Hello world!

Does anyone out there have a circuit which allows more than the one ATARI serial port to be used? I am thinking in terms of a card which attaches to the DMA port, rather than some means of modifying the MIDI port. OS9 supports at least 8 serial ports and I want to be able to make use of at least 3 of these.....

Thanks in advance!
Andrew Miller.

15. Programmin Windows in GFA Basic 3.0

Source record: 240583

I don't know if this has been asked before, but here it goes...

I'm writing my first GEM application, and I'm using GFA Basic 3.0. I would like to know how to put text in a window, and what do you have to do to make it scroll and such. The documentation with GFA isn't the best in the world, and it doesn't explain how to do anything, just trial and erro ron my part. (I did get my .RSC file loaded in, and it working, it wasn't that hard!!)

Don't forget a MultiSync monitor (~14") and AmigaVision (which is awsome)
and WordPerfect all thrown in at the same price, with a 1yr. waranty.

That 2 wait state bit is incorrect anyways!

The resolutions are over 1300x800 with overscan and Pal options that are fully
viewable from edge to edge or not, which is all possible on the A1950MultiSync
which is included!

ps. And a ST-emulator if you want.

Ick.. so no one really knows hmm? too bad.. so which is better, the STe or TT? logic serves that the STe should be released in the states before the TT right? How long has the STe been releaed outside of the US? If maybe a year or more, than perhaps the TT would be released here and the STe forgotten for U.S. release, so that the U.S. can catch up with the rest of the world?

21. Re: Illegal Editing, Tampering of ST Report by Greg Lindahl

Newsgroup: comp.sys.atari.st
Date: 1990-06-02 02:17:03 UTC
From: MICHAEL_ARTHUR@bdt.UUCP
Message-ID: <2943@bdt.UUCP>
Source record: 240592

I, Michael Arthur, am not trying to threaten anyone. Ralph Mariano simply asked me to post a message to attempt to get Greg Lindahl to stop "tampering" with ST Report's content.

Here is part of what you posted:

> Since ST Report is a copyrighted publication, and such editing is illegal,
> Ralph Mariano wishes to express his sentiments that if Greg Lindahl is indeed
> doing such a thing, that he stop immediately, because such actions would
^^^^^^^^^^^^^^^^^^^^^^^^^
> incriminate both Greg Lindahl and other sources which he uses in the course of
^^^
> perpretrating such acts.

For some time, Greg has relayed ST Report to a mailing list as a volunteer effort, without any personal gain, as a favor to people who wanted to read it. What have you done for the benefit of the network? You have issued threats.

You are not only threatening Greg.

You also are threatening the NSF Internet, its associated networks, and all the individual UUCP sites through which ST Report might be transmitted. How else am I to interpret it?

Thanks a lot for doing your bit for unity, harmony and gracious behavior.

I did not mean to imply what you are saying, and if I did, I apologize sincerely to both you, and all of the sites which may possibly have carried ST REport.

Ralph Mariano said that such actions would only be aimed at Greg Lindahl and possbibly UVA, if and only if Mr. Lindahl didn't stop changing ST Report to suit his own style of thinking.

Neither I, or Ralph Mariano are making threats against anyone. Ralph Mariano is saying that Greg Lindahl doesn't have the right to edit ST Report, since he doesn't make it, and is violating the copyright laws....

I will next post what Ralph Mariano has said in this week's issue of ST Reoprt, in order to COMPLETELY clear up whatever misconceptions there are about what he said....

22. Ramdisks and my STe

Newsgroup: comp.sys.atari.st
Date: 1990-06-02 02:34:25 UTC

Message-ID: <1990Jun2.023425.26696@sun.soe.clarkson.edu>
Source record: 240588

Since I aquired my 1040Ste, I have not found a reset proof ramdisk that
didn't bomb my system upon installation.

I found the SI_RAM ramdisk (and print spooler) to be an acceptable non reset
proof alternative, but now that I am using the AMCGDOS that comes with
GEMINI (wow, GEMINI is GREAT!), SI_RAM bombs!
So, I Started using M-DISK (a REALLLY old Michtron product), but it limited
my ramdisks to 720k (which sucks if you have 4Meg :) so, I disassembled it
and raised the limit to 2Meg, but now it bombs when I put alot of stuff in it.

ANYWAY! I am really getting frustrated.

What ramdisk programs are proving to be reliable? and at which site can I
find them?

Anyone else with an STe having problems?

Here is what Ralph Mariano has said (in this week's issue of ST Report) concerning the "Greg Lindahl" issue

> COPYRIGHT! STR Spotlight? STReport "chopped up" by college student
==========

THEY SHOULD KNOW BETTER
==========

by R.F. Mariano

Copyright violations of all types are, for practical purposes, an integral part of the computing community. Oddly enough, the most serious offenders frequently appear to be those who do or, at least should, know better that to perpetrate such non-sense. From outright theft of software to the brazen copyright infractions recently brought to our attention, it would appear that people have little or no respect for the rights of others regardless of the damage or harm they cause.

STReport finds its issues are, at this time, being sent through USENET by Greg Lindahl, who apparently is under the misguided impression that he has been granted some sort of editorial powers beyond the bounds of the copyright notice contained in each of our issues. It seems this young man, by his own messages, openly admits having edited and/or deleted various items from STReport.

A number of well meaning individuals who frequent Usenet have brought this serious matter to our attention. They have clearly stated that this is an ongoing situation and have provided STReport with sufficient materials to substantiate their allegations. Further on, we present an excerpt from the materials.

STReport formally requests of Mr. Lindahl; Please discontinue your editorial activities immediately. Additionally, to all parties concerned, STReport Online Magazine may be retransmitted in any form provided each issue transmitted is complete and complies fully with the copyright notice posted in each issue.

STReport " Independent News Source" June 01, 1990
16/32bit Magazine copyright 1990 No.6.22

Views, Opinions and Articles Presented herein are not necessarily those of
the editors or staff of STReport, CPU/STR, or CPU Report. Permission to
reprint articles is hereby granted, unless otherwise noted. Each reprint
must include the name of the publication, date, issue # and the author's
name. The entire publication and/or portions therein may not be edited in
any way without prior written permission. The contents, at the time of
publication, are believed to be reasonably accurate. The editors,
contributors and/or staff are not responsible for either the use/misuse
of information contained herein or the results obtained therefrom.

This article (posted with his permission, BTW) represents Mr. Mariano's
opinion concerning Greg Lindahl's actions....

He also told me personally that if Greg Lindahl continues to warp the content
of ST Report to suit his tastes, then he will "contact the University of
Virginia's legal department to inquire as to why they are allowing Greg
Lindahl to break the copyright laws"...

I CANNOT stress more CLEARLY that Mr. Mariano is not threatening, and does not
intend to sue Usenet, Internet, Arpanet, or ANY of the organizations which you

said he may. If the message that I relayed gave that impression, then I apologize. However, he has said that UVA and Greg Lindahl are the two parties "seemingly" involved in either condoning or participating in Greg Lindahl's activities...

The above represents Mr. Mariano's opinion, and I am merely the messenger....

However, I myself personally feel this is an issue about copyright violations, nonwithstanding any opinions about ST Report's content itself....

24. SM124 Monitor Problems

Newsgroup: comp.sys.atari.st

From: Bill_von_Hagen@TRANSARC.COM
Message-ID: <caNnxIH0BwwfN8Nkps@transarc.com>
Source record: 240593

I am having a weird problem with my SM124. After using it for 10-15 minutes, four vertical black lines appear on the screen, flickering in and out. In another couple minutes, the entire screen goes into reverse video, from which it never returns. This is especially irritating in Mac-mode or when previewing TeX. Anyone have any ideas what I can do? I've opened it up, looking for fried components, but found nothing meaningful. All of the computer dealers in my area seem to have punted Atari's, so I'm pretty much on my own. Help!!

Thanks in advance!!!

Just thought I'd support the other side... I DO own Spectre and I think the
phrase "nearly compatible" is a little bit misleading. I have found it to be
compatible with EVERY macintosh application that I cared to try. The only
stumbling block is that copy-protected software won't work. Anyway, the point
is that it's no less compatible than your average PC clone. (The fact that
you're using macintosh roms probably help with that...)

I use Maxidisk on my STe (German version). It even compresses files as they are stored on the ramdisk with little aparent speed loss. I think it is available from terminator.

>Anyone else with an STe having problems?

The Problems I have are with double clicking on programs, sometimes they refuse to run and present a dialog asking for SHOW PRINT CANCEL just like for a document. The wierd thing is this fault is intermittent. Anyway I think it is solved by saving the desktop (Old ST desktop.inf seems to cause the proble.)

Listen, you don't have to worry anymore. Greg has stated that he will
no longer distribute ST-Report since it is now explicitly forbidden to
remove all the ridiculous advertising. You can rest assured that the
only concrete result of your/Ralph's actions is that a few thousand
fewer people will read his piss-ant little magazine. I know Greg
distibuted it to a few hundred people and I'm sure many of those people
in turn distibuted it to others. I personally used to forward my
copy to about 10-15 others after I received it.

Ralph, you and your mouthpiece (as usual) are behaving like complete
babies. If you had intended to decrease your already small circulation,
you have indeed succeeded.

Regards,

Chris

This is a quickly done translation of the first review of Medusa, the
Atari ST emulator for the Amiga 2000. Please excuse the probably rough
English. I don't believe that I'm required to produce Marketese ;-)

I have left the prices in Deutschmarks since this news group is quite
international. Most people are probably aware of their exchange rates
with the Dollar, so here is the exchange rate for Deutschmarks to
Dollar: 1 $ is roughly 1.67 DM.

New perspectives from an Atari in the Amiga

Atari ST Computers are technically inferior to the Amiga in Video and Audio.
Despite this, they have won a quantitative and qualitative advantage in
areas like text processing. After inserting Combitec's emulation card
Amiga users can employ the powerful software of the seemingly weaker
computer.

Following Readysoft's emulator A-MAX another emulator makes new worlds
acessible to the Amiga. Instead of trying to imitate the Apple
Macintosh, Combitec's Medusa tries to emulate the Atari ST as closely
as possible.

Somebody imagining the emulator as a complete Atari ST on a plug-in
card will be surprised. On the small Medusa card for the 100 pin
Amiga-slot he will nmainly find two logic components (PALs) that
enable the Atari ST software to use Amiga hardware. WIth this the
purchase of Atari hardware is superfluous und possibly ensuing
copyright problems are avoided.

Medusa requires an Amiga with at least 1 Megabyte RAM and a diskette
drive. Combitec recommends a 2 MByte RAM expansion to be able to work
```

with programs that require more memory. The emulator uses the entire Amiga memory without problems. Also used are all interfaces, the diskette drives (read and write-compatible with original Atari 720 KB drives) and certain hard disks. Printers and plotters can be used, too. The owner of a well equipped Amiga owns also a well equipped Atari.

After inserting the card Medusa can be started immediately. The software can be loaded directly from diskette or hard disk and is not copy protected. The Amiga part of the software consists primarily of the Medusa program - the emulator proper - and the installation software that is needed especially for using a hard disk.

The Atari operating system TOS (Tramiel Operating System) - not included in the package - can be stored on hard disk and be loaded from there. Owners of a Combitec filecard or a Combitec AutoBoot card can create a bootable parttion of their hard disk for the Atari ST.

A short and clear installation program facilitates TOS installations on Amiga diskettes or hard disks, theassignment of Amiga diskette drives to the Atari, the creation of an Atari partition on hard disk and the adjustment of video refresh.

The problem of getting the operatin system of the emulated computer is prevailing among emulators. For the Macintosh emulator A-MAX the original Macintosh ROMs are required, but cannot be delivered with it for copyright reasons.

For Medusa this problems can be solved relatively easily: For one the dealers are seling Ataris TOS as a diskete version for 15 DM, and a program called "GetTOS" is delivered with Medusa that, started on an original Atari ST, reads the TOS out and writes it to diskette. This diskette can be used for the emulator directly or as a medium for the hard disk installation. Sources for the diskette TOS are referred to by Combitec on request. Combitec points out that the legal questions have to be checked out before copying the TOS. In doubt Atari has to be asked for permission !

For the test the TOS version 1.0 was available on diskette.

According to Combitec the capability is planned to put the ROM-TOS into sockets on the Medusa card. Since TOS can be loaded from hard disk in a few seconds, this plan was shelved for now. In daily use this solution provides greater flexibility since users can choose between different TOS versions that can all be stored on hard disk.

After installation a typical Atari desktop screen appears on the Amiga monitor. Since HiRes mode is pre-selected it is an interlace screen. The characteristical flicker is somewhat abated as the refresh frequency of the monitor (1084 et al.) can be increased from 25 Hz to 31 Hz or even 35 Hz for better devices. This facility does not require a special Agnus chip. In LoRes or MedRes logically the double of the HiRes frequency can be used, up to 70 Hz. This represents an

absolutely stable image.

One has to experiment to find the ideal value: an accessory included with Medusa (a program that can be reached at any time on the Atari ST) allows the variation of the setting from the emulator. If the screen is showing a wild image instead of the normal screen the monitor cannot keep up. Very useful in this procedure is the feature that allows to switch back to the standard Amiga setting (this is always working) at any time.

"Signum! 2", the extremely successful scientific text processing package, is an important program to find out about compatibility and flawless function of the emulator. Texts could be processed and printed without perceptible difference in speed. With the progres of the test this impression got firmer. Programs like Calamus, Arabesque, Tempus and Tempus Word, STAD, GFA-BASIC, Adimens, Psion Chess and Turbo C ran without problems like on the original ST. Even the software accelerator Turbo-ST ran and helped Medusa to a fantastic text output speed.

As the shareware performance program Qindex ran, too, it was possible to test the speed of Medusa: 95 to 98 percent of the original speed were attained. Under Turbo-ST Medusa peeked to 1160 percent of an original ST without Turbo_ST.

But the limits of the emulator became visible, too: third emulations like Aladin, the Macintosh emulator for the ST computer, did not run. Many games did not run likewise. This is pointed out in the manual, because if a program assumes certain hardware prerequisites that are not present in the Amiga - like the original ST diskette drives with index hole controlled hardware - and uses this hardware circumventing the operating system, this environment cannot always be emulated.

Combitec expect direct user participation on enhancing Medusa because of a one year, no-cost update service. The manufacturer says they are dependent on cooperation with manufacturers of hardware and software to support more hard disks or software protected by dongles, like that in the midi market, to make Medusa workable.

As said, Medusa works without problems with memory expansions, diskette drives and hard disks. Flicker fixer cards do not disturb the emulator likewise. But it is not possible to use the emulation if 68020 or 68030 cards are installed. This is not because of Medusa, but because of TOS: The present TOS versions run with the 68000 processor only.

Combitec is waiting for new TOS versions, like that for the long announced Atari TT. There are already deliberations to run the Atari as a screen on the Amiga. To speed up the emulator, a card called "Piccolo" is announced that with provide a 14 MHz 68000 and 256 KByte to 1 MByte memory. The memory is designed with SRAM so that switch-off resistent storage of Kickstart or TOS in fast RAM is possible.

(J. Sprave/rg)

The Combitec development "Medusa" is sold by MacroSystem,
Gahlenfeldstrasse 6, 5804 Herdecke, Germany. Phone +49/23 30/80 11 32.
The price is DM 498.

The German version of this article was published in Amiga Welt 6/90,
pp 50/51. This translation does not reflect the opinions of the
translator, who is only a reader of that magazine and in no way
related to either the publisher or Combitec or MacroSystem.

I did this translation because many people have been talking about
Atari emulation on comp.sys.amiga. I do not want to purchase this
system myself and please don't flame me if you don't like the contents
of this article of the rough cut translation.

Ok, here we have a statement that actions might be taken...

>Neither I, or Ralph Mariano are making threats against anyone. Ralph Mariano
>is saying that Greg Lindahl doesn't have the right to edit ST Report, since he
>doesn't make it, and is violating the copyright laws....

And here we have a statement that no threats are being made.

Well, that's good. But note that anything you can sue UVa about for
distributing ST Report can be used against every other institution on
the Internet which had this mail carried over the links that they
lease. Come to think of it, you could sue the telecomm companies that
own the lines, too. I hope Ralph knows what he's getting into.

Second, Ralph isn't a lawyer. I'm amazined that he's so sure that I'm
violating laws. I am not a lawyer, but it's obvious that I'm not
violating the old ST Report copyright. I would suggest that you go
look at the back issues at the changes I actually made before you or
Ralph jump to any conclusions. Or maybe Ralph prefers it if I leave in
misspellings and factual errors. Maybe Ralph prefers it if I violate
UVa policy, US Government policy, and lord-knows-what-other-policy by
leaving advertisements in something I send over the Internet.

Third, the only result of Ralph's action is that he has destroyed any
possibility of ST Report being carried over the Internet. I have some
261 people directly on my mailing list, and they passed ST Report on
to many bbses in the US, Europe, and other continents. Perhaps next
time he might send me some email before he cuts his own nose off.

Fortunately, there's no problem here. Almost all of the people above
also receive Z*Net, which is (IMHO) a much better magazine, full of
interesting articles, stimulating editorials, and has no advertising.
The only thing I've ever cut from Z*Net were entire articles that had
nothing at all to do with the Atari ST. And the Z*Net copyright
continues to allow me to do so. Thanks, Z*Net.

>I will next post what Ralph Mariano has said in this week's issue of ST
>Reoprt, in order to COMPLETELY clear up whatever misconceptions there are
>about what he said....

I hope you got permission from Ralph, because you just violated his
copyright. I hope he doesn't sue you.

Have a nice day.

>That 2 wait state bit is incorrect anyways!
Now that is what the article in BYTE states (2 wait states).
It also states that it can transfer 32 Mbytes/sec in burst transfer, and good
weather.
My 68030 data sheet says that after the transfer is initiated the CPU will
read ONE 4 byte word every cycle (on a 25Mhz 68030 it means 100 Mb/s???).
Any way the graphics part of the machine, is doll except for the figure 1280,
the bus is 16 bit (call that a 32bitter again), to be compatible or ????
The main feature added to the graphics subsystem is a flicker-fixer.
As I remember C= promised 16M colors, 32 bit blitter and more of that kind.
The 68030 have instructions to manipulate bit aligned graphics (such as
Bitfield Insert). Which means that if it were on a fast bus it would not
need the blitter, as the bitblit loop would run from the internal cache, and
not compete on buscycles for fetching instructions.

And 1280x800 is with interlase. [to superpositioned 1280x400 images, or so
it appears to be on a 500 ;-)]

Yes in comp.sys.amiga, I read that the chipset would be available to the
16 bit series too. And 1280x400 (without interlase) should be possible
on 500 to (it is the same number of buscycles as 640x200 in 4 bitplanes),
and the basic 500 runs just about 2 Mhz in that configuration :-()

[We ran a small program which should execute in 90 secs (2 DBRAs)(7.09Mhz),
and only when we turned the screen off we could get the 90 secs, and
in 640x4 bitplanes, it took 260 secs!!! (remember ZX81 (or Timex) :-)]

>ps. And a ST-emulator if you want.
[How does you simulate 640x400 noninterlase 72 Hz quality]>

Hi, I have master tracks pro 3.5 for ST, and I was wondering
how I can score my midi stuff (and do my own scoring) w/o having to
either buy a mac or get a mac emulator and buying Passport's Encore.
Is there a scoring pgm that can read my mastertracks pro files, whcih
I assume are std midi?

And why are these scoring things so expensive anyways?

PLease mail as I don't get to read news often.

Thanx in advance, fo

42. Hard disk upgrades

Newsgroup: comp.sys.atari.st
Date: 1990-06-03 15:04:03 UTC
From: jlf@cs.wvu.wvnet.edu
Message-ID: <758@h.cs.wvu.wvnet.edu>
Source record: 240462

It seems that the time for me to upgrade my hard disk system has come and I have some questions that I would like to pose to those of you who may have already done what I am considering. Please reply by email, and if I get enough requests, I'll summarize to the net.

What I am considering is popping the mechanism out of my Supra 20Mb and dropping in an ST177N mechanism in its place. My concerns:

- Will the Segate drive fit?
- Can the power supply handle it?
- Will the 50-pin ribbon cable that attaches to the Miniscribe work with the Segate.
- Can the Supra formatting software format the drive? (My selector box on my version of the software doesn't list the ST177. Can I just specify the number of heads, cylinders, etc to the software and make it work?)

If anyone has successfully done this, I would really appreciate and words of wisdom and advice you could give me.

The reason I want to do it this way is that the new drive will end up in a new computer (perhaps a TT? :-) eventually and I don't want the extra expense of a case, power supply and a fan.

My address (in case my .sig doesn't appear) is

This 'feature' is also present in TOS 1.4. Some motherboards seems to have
trouble with the new ROMs, whereas other motherboards work just fine.

> water soluble.

I've been printing with their ink for a while and the print quality is almost as good as the genuine HP stuff (it 'spiders' just a little more.) It still smears when wet, though--I don't know if it's *more* waterfast than the HP ink, but it's not *completely* waterfast...

The ink that they sell is a squeeze bottle with a syringe tip--you stick it into an empty HP cartridge, squeeze (for a few minutes--syringes are always slow), and you've refilled the cartridge. Each bottle has more than enough ink, so you can usually top off a second cartridge.

Note that certain mail-order places sell real HP cartridges for about $15. (Plus shipping, etc.) The walk-in cash single-unit price for the GU refills in Cambridge, Mass has been about $13.

Date: 1990-06-04 04:00:47 UTC
From: vanleeuw@udcps3.cps.udayton.edu
Message-ID: <1990Jun4.040047.12417@udcps3.cps.udayton.edu>
Source record: 240469

I found this press release on GEnie and I thought that I would pass it on to the rest of the world. If any more information comes out, I'll do the same...

**** PRESS RELEASE ****

June 1, 1990 -- For immediate release.

JMG Software International, located in Hamilton, Ontario (Canada) and Niagara Falls, NY (US), announces development and pending release of a significant new product for the Atari ST market.

This product is called >HyperLINK<, and represents a major new application combining hypertext features with graphics, sound and data manipulation. HyperLINK actually has many different facets, depending upon the user's requirements. It can function as a hypertext controller, or a database system combining relational features with graphics and object support, or a front-end for special hardware devices. But much more importantly, it can generate "HyperLINK Applications", self-contained programs that can be any combination of the above.

HyperLINK is scheduled for full release by Fall COMDEX, in November; shipments of a subset of the full Hyperlink system may start as early as the German Atari fair in Duesseldorf in August, with free upgrades to the full system by November.

JMG Software encourages interested people to contact us if interested in being entered onto our HyperLINK mailing list; in addition, any questions, comments and especially suggestions are encouraged.

Please forward any comments/suggestions etc to GEmail address G.GECZY1 .

A sample HyperLINK application will be uploaded to Genie within the next few weeks to give some feel as to the power and versatility of this product.

JMG Software International Inc,
Canada: 801 Mohawk Road West, Hamilton, Ontario L9C 6C2
US: 2201 Pine Ave, Niagara Falls, NY 14301
Voice Phone: 416-575-2867
Fax: 416-575-0283

-- George Geczy, President.

The following is a more detailed description of this powerful new

Atari ST product:

HyperLINK?

What is HyperLINK?

HyperLINK can be viewed as quite a number of things. Most simply, it is a managing program for any (reasonable) number of HyperLINK Applications and Modules.

A HyperLINK Application can be something as simple as a flat filing system, or as complex as a mini word processor or relational database.

A HyperLINK Module is more of a "tool", for use by HyperLINK Applications in manipulating or collecting data, or controlling external devices or actions. A simple example of a HyperLINK Module is a routine to convert graphics for display in a database Application, or a driver for a CD-ROM or Laserdisk, as well as sound, music, and speech Modules.

The true power of HyperLINK lies in its Hypertext-like capabilities. Hypertext is a system (or theory?) developed mostly in 1970's that aspires to replace normal, linear text with smaller text topics "linked" to each other. This system can be applied beyond simply text to encompass data, graphics, sound, and external control as well (these days, this is popularly called Multi-media).

An example of Hypertext

As a simple example of Hypertext, imagine a file listing software for the ST. In the title page, you select the heading "Multimedia Applications", and a list of available multimedia programs is displayed, possibly with some information on multimedia programs in general. You then select HyperLINK from this list, and a page of information on HyperLINK is displayed. If it were a very comprehensive file, it might even let you select topics like "hypertext" and "database" and look up general definitions or explanations. Or, from the HyperLINK description, you could select JMG Software's name and be shown a list of all the applications we develop and general information about us. (To take things one step further, under our company listing you could select "ST Software" as being our specialty, and that link could take you right back to the table of contents of the ST software guide - a complete circle. That's the fun of hypertext.)

An example of HyperLINK

One of the simplest examples is the Message/Address/Calendar Application set developed for HyperLINK. The phone Message App lets you take standard phone messages, enter them on a graphics-based screen and store them in a database. But then, to call up information on a company or a person named in that message, just click

on the name and it will display the Address book form with any information available. Then you could click on the Appointments link and it would display on the Calendar form any appointments made with that person. You could then zoom in on one particular day's schedule, and even go look at the Address or Message record of someone else from that day.

Another example developed is a "Music Sampler", which uses a HyperLINK module to control the Atari CDAR CD-ROM Player in music mode. It would display a list of CD's on which data has been entered, and let you pick one to sample. Assuming you put the correct CD into the drive, it would give a list of all tracks on the CD, and from it's database provide information on each track. You could then call up an extended information screen on that track, providing some history or information, or you could call up text on the composer/artist or author (with picture of course). All while having the computer play the requested selection for you.

HyperLINK capabilities

HyperLINK can create links between any sort of data (one Application to another) and Modules. All you have to define is how to do the link, and HyperLINK will do the rest. For instance, Hyperlink has a build-in dBASE compatible database manager. It automatically knows how to look up a name found in one database from another, you just tell it what fields to use. For more involved links, you can include custom modules for the application. An assortment of such modules is provided with HyperLINK, and any others can be added at any time (ie programmed in C and loaded into HyperLINK with it's Module-load feature).

Each Application is provided its own windows for its forms, so a full history of links can be present on the screen at the same time, and you can effectively edit all the data displayed at the same time. A single application (ie the Message App) can have multiple windows displayed at one time as well (making this the first program to use the "cluttered desktop" metaphor).

Some Specs:

- Fully dBASE III / dBASE IV compatible database manager included.

- Support for Moniterm and other special monitors; support planned for all TT graphics and colour capabilities.

- Custom windowing feature allows greater than 7 windows active.

- "Launch" feature to run other programs from within HyperLINK; includes parameter passing and clipboard use if the destination program supports it.

- dBASE data support, Text Support, Graphics Support, Digitized Sound Support, Speech Support, and HyperLINK Module Support all standard.

- Document hypertext capability standard, allowing use of existing or new text files as hypertext documents or HyperLINK control forms. (ie link text to text, text to graphics, or text to another HyperLINK form, Application, or Module.)

- Ability to actively link two computers together to share, real-time, information. (Serial or Midi).

- Support Modules for Atari's CDAR-504 CD-ROM player also included.

- "HyperLINK Module Protocol" will be published and distributed public domain to allow third parties and experienced end users to create HyperLINK Modules for special purposes. (Use of custom HyperLINK Modules will effectively allow virtually anything to be linked to anything.)

- Allows compiling "HyperLINK Applications" into stand-alone programs that may be distributed either commercially or public-domain.

- To be distributed with sample HyperLINK Applications: Message, Phone List, Address Book, Calandar and To-Do; Document Hypertext Sample; Database-Graphics-CDROM Sample.

The possibilities are endless....

>called GEMFILE.GEM and then crashes. I get 2 bombs and it does not come
>back from that command.
>

I haven't figured it out yet, but after going through the code
with a debugger for some hours, I found something that might or might not be
usefull.

For some reason or other, the code segment where it crashes, it
seems to be looking for a pointer at f9ee which turns out to be NULL. I
don't know why this is, but that is the reason for the bus error.

What is at f9ee? Is this something a user program should know?
Somehow I doubt it.

Thanks for any input.

From: sbarr@ic.sunysb.edu
Message-ID: <9739@sbcs.sunysb.edu>
Source record: 240470

Would a few people be kind enough to send me information on the
various C compilers that are out there for the ST and how they
feel about them. (Also state what they use them for).

I'm currently using Mark Williams C 3.0, but unfortunately Mark Williams
has abandoned the ST due to its poor sales (EVEN IN GERMANY!)

I'm searching for something ANSI compliant.

Thanks in advance,

San

52. Atari digests - have they stopped?

Newsgroup: comp.sys.atari.st
Date: 1990-06-04 09:44:37 UTC
From: grahamt@syma.sussex.ac.uk
Message-ID: <2791@syma.sussex.ac.uk>
Source record: 240482

Mathew Lodge from York has asked me to post this: if you wish to mail a reply, please send to SOCS18@vaxb.york.ac.uk

Is there a problem with the Atari digest mailer? Mathew's not received any digests for a while now. He says he thinks the digest machine has been on the move, but he doesn't know if that move has yet been completed. He's tried to mail SIMTEL20, but has been unable to get through.

Mathew (and presumably other users) would like to hear from anyone who knows whether the digests are still being distributed. Are they arriving at your site?

Thanks,

Graham

The Spectre GCR is really the one you want, so in reply to your questions:

>How compatible does this make the Atari to the Mac?

Pretty much totally software compatibile, though obviously you cannot fit in any Mac cards or run some of the Colour software.

>Will this package continue to be supported?

As far as I am aware, yes.

>How stable is the company that produces this package?

About as stable as you are gonna get. They have been around for a while, and should be with us for some time to come.

>Does it run Mac programs slower than Mac?

That depends on which Mac you are talking about, but it is a bit faster than the Mac + and Fat Macs.

54. 1200/75 baud comms program?

Newsgroup: comp.sys.atari.st
Date: 1990-06-04 11:58:08 UTC
From: huw@extro.ucc.su.oz.au
Message-ID: <1990Jun4.115808.25576@metro.ucc.su.OZ.AU>
Source record: 240472

Does anyone know of a PD or shareware communications program for
the ST that supports a 1200/75 split baud rate?

Thanks,

>they love their machines who stick by their machine because they know it's
>a neat toy, and then there are those anal retentive misanthropes that give
>the entire user community a bad name.
>
>Greg: You did a great job with ST Report. I really enjoyed being able
>to grab it off the net. Mr. Mariano is a jerk, period.
>
>Mr. Mariano (Wherever you are): Get a life!

after following this controversy (if you can even call it that - farce is much more appropriate), i can only say that Mr. Mariano, "Get a life!" (oh god, i hope that Scott doesn't sue me for copyright infringement on that quote!!!) :-)

i have met Mr. Mariano in person, and i was NOT particularly impressed, and i'm not concerned if Mr. Mariano thinks less of me now either. i will not go into details in public, but i expected this reaction to Greg's "tampering". i just want to say that he was doing a good job, but i guess he's going to have to stop now. too bad! :-(
(btw, i don't really read either mag - i have better things to do with my spare time :-)

this is another reason that i have left Branch Always Software. This kind of nonesense is simply a huge pain in the butt, and i have no time or patience for it anymore. i have a life, and it will be involving the Atari even less from now on. It's a shame. The computer is fantastic, but many of the people involved with it are just plain idiots and asses (i'm not pointing fingers here at anyone in particular). i never thought that i would get pissed off at the atari community ever, but i have, and i'm not going back. and if this developer (myself) has these views, i'm sure that many others out there share them as well, and the Atari community will suffer as a result.

all i can say is that i hope this issue is resolved SOON, and amicably. Otherwise, many people, maybe including myself, will soon be hitting the 'u' key to unsubscribe ...

(my 0.02 (~0.03 canadian) worth!!!)

(this sort of reminds me of the Meech Lake fiasco here in the Great White North!)

From: sinner@csd4.csd.uwm.edu
Message-ID: <4282@uwm.edu>
Source record: 240473

I am interested in hearing of others' experiences with a product from
Alpha Systems, of Macedonia Ohio, called Switch Back. In particular,
how does it perform with game programs? Programs that look for everything
on drive A? Programs that poke a lot of strange memory locations?
Copy protected programs?
Also, what particular games does it work with, and which ones doesn't
it work with?

From: omerzu@quando.UUCP
Message-ID: <1538@quando.UUCP>
Source record: 240477

I have a Mega-ST with a Megafile30 attatched to it.
The HD has a bootable driver installed.
In the AUTO-folder on C:\ I have a program `TOSLOAD'
(by Julian Reschke (?)) which boots TOS1.4 from C:\TOS.IMG.

My problem:

When TOS1.4 comes up, it persists to boot from floppy A:,
ignoring the bootable driver on C:.
The only way to get back to HD seems to have an AUTO-folder on
A: with AHDI and CAUTO.

Anyone any solutions (besides buying new TOS-ROMs)
to avoid executing files from floppy?

Thanks,
Thomas Omerzu, omerzu@quando.quantum.de

Source record: 240481

Thanks to everybody who emailed a response to my request for a DM hint, I received mail from Norway, Germany, Holland, UK, Australia, Canada, & US.

The solution is to place a heavy object (shield or box) in the blue curtain area, with the curtain off, and then turn the curtain on.
This teleports the object into the alcove -- activating the switch & opening the gate.

Thanks again.

Tyler

PS - It's nice to hear from so many ATARI ST users. Sometimes I feel like I'm a lone-wolf with my Mega. All my friends have PCs or Macs or AMIGAS (yuk, yuk, akk-phoey!)

```
Hello,

Some time ago Howard C. Johnson sent me minihdx.c and mkfs.c.
Minihdx.c is a formatter for BMS-200 controllers.
Unfortunately some interesting parts are missing: minihdx.c includes
the file "backup.h", but this file wasn't included in the mail I got.
Also a source file with get_sense(), scsi_driv() ans disk_sense()
would be nice to have 8-).
I would have mailed Howard directly, but I do not have his address.

Could somebody send me the missing files or give me the mail address
of Howard ?

Thanks in advance,

Remco

PS: The C-source of another disk formatter would also help me a lot!

64. Double Ghost Effect

Newsgroup: comp.sys.atari.st
Date: 1990-06-05 00:34:11 UTC
From: math1205@waikato.ac.nz
Message-ID: <646.266ba6c3@waikato.ac.nz>
Source record: 240483

I have been experimenting with sprite animation recently and came up
with an unexpected result which I can not explain.
The experiment uses the A_line routines and a 50Hz colour monitor to
animate a sprite moving back and forth across the screen. The program
was a simple loop which did the following:

a_drawsprite(x,y) Vsync() a_undrawsprite() update_pos(x)

The sprite used was a small 8x8 pixel ball and the x-increment used is
16 pixels. This worked nicely and gave a very smoothly moving ball at a
refresh rate of 50Hz.

I seemed to recall from computer graphics literature that a refresh rate of
20 Hz should be sufficient to give the impression of animation. I therefore
modified the above loop to this:

a_drawsprite(x,y) Vsync() Vsync() a_undrawsprite() update_pos(x)

I then expected to see a ball travelling at half the speed and refreshed
at 25Hz. What I actually saw was two very faint balls adjacent to each other
travelling across the screen.
Even when the x-increment is reduced to 1 pixel the same effect is
noticeable as a blurring of the image.

Can anyone explain the reason for this double ghosting effect?

Wayne Schou

From: icsu8053@caesar.cs.montana.edu
Message-ID: <2044@dali>
Source record: 240484

I'm interested in buying minix this summer but I have a few questions:

- How well does it work in about 10MB of disk space?
- Can you read ST disks?
- How well does it interface with a modem, printer and mouse?
- How much modification do Unix sources need to compile with gcc under
Minix?
- What kind of shell(s) can you use?
- How well does the remote logon operate off the rs232 port?
- How happy are you with the package?
- How much does it cost?
- Where can I get it?

Thank you for any information.

This is all pretty comical...

I don't care about ST Report one way or the other.. when there's something in it I want to read, I get it from one of several sources that have nothing to do with UseNet...

What's really been amusing though is the number of people here who are willing to have Greg Lindahl do their thinking for them...

Perhaps we should let him censor our daily newspapers too... that way he could just snip out any articles he doesn't think are interesting.. think of all the wasted time and reading we'd save by letting him do our thinking for us...

Come to think of it, there've been some really boring articles in STart at times.. maybe we should let him scissor out those... and the ads too!

I dunno, it sounds pretty scary when people start letting someone else think for them...

Source record: 240490

Greg Garber asks:
>How exactly is it that a person can become an official Atari software
>developer? I know there is a fee, but who and where can I contact someone?

Probably the best thing to do, to make sure you get all the details would
be to call Charles Cherry or Gail Johnson at Atari Corp. Unfortunately
I can't find their individual numbers here, but if you call the main
Atari switchboard at (408) 745-2000, they should be able to connect you.

Essentially it costs $250 to become a registered developer, which includes
the Documentation kit and software, and other incentives like the Developers'
newsletter and special pricing on hardware.

While the price has gone down, the requirements have been stiffened somewhat.
You now have to prove that you're an active software developer with products
already on the market, or provide a business plan if you don't already
have Atari related products.

Indeed it is.

>What's really been amusing though is the number of people here who are
>willing to have Greg Lindahl do their thinking for them...
>
>Perhaps we should let him censor our daily newspapers too... that way he
>could just snip out any articles he doesn't think are interesting..

What's really been amusing are people like you who decry "censorship"
without looking to see what I'm actually did. I threw out things I
couldn't pass on (ads), things that were total paranoid ravings (the
extra "editorials"), postings that were merely messages from GEnie (I
was concerned about copyright issues), and things unrelated to the ST
(CPU Report, full of factual errors, too.) When I tossed something
out, I marked them in the text, so that readers could see what I did.
If they didn't like it, they could complain. I got very few complaints
and very many thank-yous.

[I might note that it seems that Ralph never looked at an abridged
issue, either, he just read the header I started sticking on the
issues.]

I guess your idea of a newspaper is some sort of service where anyone
can submit any article they want, and the newspaper must print it.

You know, Bob, if you don't like the way I run the list, why don't you
volunteer to take it over? I don't get paid to do this job, I only did
it because I was tired of seeing people argue about posting the
magazines on this group. And my reward is getting slandered in an
international forum that I have no way of replying to. Well, fine,
I'll just distribute the magazine run by a sane editor.

So, just let me know, you can have the Z*Net mailing list and you can
take care of all the administrivia. And someday you'll find that
ultimate newspaper. But I'll bet you aren't interested, you prefer
sitting on the sidelines and sniping to doing anything real.

Have a nice day.

I've already posted a couple articles describing my experieces with it.
I like it, though I haven't needed to use it much. It's gotten less reliable
since I got my Turbo-16 installed, as well. (Takes several button-presses
to get a response, usually only takes one press.)

I've used it with Dungeon Master, but it was kind of tricky getting the
procedure started. After a certain point during game loading the SwitchBack
button is disabled. Once you get past that problem, you can save and restore
games easily enough, but the sound will be disabled. I haven't figured out
why just yet.

You have to un-done each BEG_UPDATE with one END_UPDATE
If you give more END_UPDATE than BEQ_UPDATE GEM/AES will crash!
Only since TOS 1.4 exists a method to cancel all BEG_UPDATES.
I don't know off hand what the calls name is.

Heres my $0.02.

I think Greg started with a good idea; strip the commercials and send ST Report onto Usenet.

Unfortunately for all concerned, he started cutting (and/or commenting) the body of the material. The material may have been Redundant, Wrong, or whatever, but any such cutting must change the intent of the author. This I think is wrong.

(Personally, I think that if Greg felt disclaimers were needed he should have posted a "rebuttal" with the original.)

Hopefully, if Greg sticks to his words, ST-Report will dissapear from Usenet and the author will know his document will stay in one piece, even if its unread.

BobR,

You raise a good point, it is horrible to let someone do our thinking for us. However, I do not think I would consider the editing of ST Report to be 'censorship' or 'thinking for us'. STR could not be distributed with the ads over the net...By removing those ads and distributing them greg was doing a service to the ST community, making more info available. He should have gotten permission of the author first mind you, but other then that there is nothing wrong with what he did.

There is always someone who is doing the 'thinking' for you, if editing is indeed thinking for someone. People at a newspaper are editing and deciding what is newsworthy, people at a TV Station, and unless you can be everywhere at once, you will always get an 'edited' version of things. I do not think that STR was edited irresponsibly OTHER THEN the fact that permission should have been granted before such distribution took place.

I will no longer read STR, by the way...This was between Greg and the author of STR...what is it doing all over the net?

79. Atari TT 030 Launched!

Newsgroup: comp.sys.atari.st
Date: 1990-06-05 14:32:31 UTC
From: pdbeam@watserv1.waterloo.edu
Message-ID: <1990Jun5.143231.4977@watserv1.waterloo.edu>
Source record: 240499

```
ATARI OFFICIALLY LAUNCHES THE TT 030
------------------------------------

THIS IS NOT AN ATARI PRESS RELEASE--I HAVE NO CONNECTION TO ATARI.
THE OPINIONS BELOW ARE MY OWN AND NOT NECESSARILY THOSE OF U OF W.

I went to the official North American launch of the Atari TT 030 last
night in Toronto. The TT 030 will be available in limited quantities in
Canada in late July/early August and fully available in September. The TT
will be officially launched in the US at Comdex in November. I guess Atari is
using Canada as a test market to work the bugs out of the system before they
make their big push south of the border. The expected price of the TT 030
(2Mbytes, 40M hard disc) is under $4000 (CDN). This puts it well under the
Amiga 3000 in terms of price (the A3000 is under $4000 US).

The presentation I was at was for Ontario educators. Earlier in the day
there were presentations to the press, developers, and user's groups. Some of
these earlier meetings were attended by Sam Tramiel and other Atari US
bigwigs. The educator meeting was attended by the Atari Canada general
manager and some sales managers.

TT Workstation Specifications (from an Atari Canada brochure)
-----------------------------
68030 CPU running at 16MHz (optional MC 68881/MC68882)
2Mbytes RAM expandable to 8Mbytes (26Mbytes using 4Mbit DRAMs)
Built in 1.44Mbyte 3.5" floppy
40Mbyte (28ms) Hard Disc

RGB and Monochrome Monitor Support (I saw it running a Multisync)
4096 Colour pallette, 320x200 to 320x480 with 256 colours
640x480 with 16 colours
640x400 with 2 colours (ST Hi-res)
1280x960 monochrome

Detatchable keyboard with joystick and mouse ports

SCSI and ACSI DMA ports
2 RS-232 ports (expandable to 4)
Parallel and MIDI ports
AppleTalk Interface
1 internal A24/D16 VME card slot
8-bit PCM Stereo sound
RT Clock

The TT 030 comes with TOS 2.0 which will be compatible with most existing ST
software. ST software runs about 1/3 faster on the TT 030. Software compiled
specifically for the 68030 (as opposed to ST software compiled for the 68000)
```

runs MUCH faster at 16MHz with 32-bit through-put (sorry, no benchmarks, yet). So far both Borland and Mark Williams will be producing 68030 C compilers for the TT. Apparently GNU C from the network will also compile better code on the TT than on the ST. Existing ST software can be re-compiled to run at full-speed on the TT. While ST software will run just fine on the TT, it will have to be re-compiled to take advantage of the TT extra capabilities (Math co-processor and enhanced video).

UNIX V will be available for TT in the fall. Contrary to the report in STart, the TT 030 WILL run Unix.

In the near future ISD will be releasing TT versions of DynaCADD and Calamus. At the presentation we were shown the TT 030 running ST DynaCADD and the system was noticably faster. When a TT does ST med-res, the screen has approx. 2cm borders on either side and the picture runs off the bottom of the screen. The aspect ratio is quite elongated top-to-bottom.

Later this year the tower TT (the TT/X?) will be released. Among other things, the tower TT will have four VME slots. Also to be released are an Ethernet card, a GENlock card, and a software IBM PC emulator. The Atari GM said that Spectre GCR is being ported to the TT now. Presently the TT 030 has the same GENlock capability as an STE.

Atari made no mention of their marketing intentions to us, but then again we were educators and they probably didn't think we'd be interested. I brought the issue up with an Atari official and he told me they were addressing the problem.

Also announced was the fact that Atari is now GEMS authorised to sell their PC-Compatible computers to the Ontatio Ministry of Education schools. This is a very positive step. Atari says they are considering submitting the TT to the Ministry for similar approval.

I think Atari still have a lot of promises to keep (UNIX, hardware cards, software), but if they do then I think the TT will be a strong machine with good prospects in the future. It certainly gives the Mac II and A3000 (not to mention Sun) a run for their money in terms of providing a platform for UNIX.

>Dave Halliday.
>(D.C.Halliday@newcastle.ac.uk)

Nah, I think that's a feature of TOS 1.6. The guys at Atari thought it might be nice to look at the code rather than run the program from time to time.

I'm not sure about the fix, I think that bug has appeared when I was using the desktop inf file on my hard drive, which is definitely an STe version. I find the best way to beat this bug is to buy Neodesk(!)

Mark.

81. Re: ANSI C Compilers

>I'm searching for something ANSI compliant.

Prospero C is ANSI compatible, the documentation covers libraries, VDI, AES and compiler, debugger, librarian, workbench and language implementation (comes to about 1000 pages).

The compiler is not lightening fast, but it's bareable. The code it produces tends to start at around 15k for small programs with only a couple of libraries, but Prospero reliably informed me that it is intended to produce small big programs (sic).

The speed of the code is average (originally about Lattice v3 speed but it could be better now).

The debugger is good and allows a machine level debugger like SID to be linked in for extra precision! It's symbolic with trace, breakpoints and stuff.

I think the current version is 1.143 (or thereabouts).

Prospero offer phone support, send you the occasional newsletter and allow you to upgrade to the latest compiler version for 10 pounds handling charge. Good stuff!

Mark.

82. infos wanted about adding drive in megafile30

Newsgroup: comp.sys.atari.st
Date: 1990-06-05 16:23:00 UTC
From: ciceron@chorus.fr
Message-ID: <5385@chorus.fr>
Source record: 240401

One month ago, Claus Brod has posted in comp.sys.atari.st an article about
adding a new drive in the megafile 30. I'd like to add another drive but
I have several problems about drive compatibility.

o if the new drive has not the same capacity (30Mb), suppose
20Mb, how does the driver (basically the i8085) recognize the new
size? (recognition of # of heads, # of cylinders ?)

o if the new disk seek-rate is different (prefer faster), will
this new seek-rate be recognized (without any effect on old disk)?

o I have noticed in my megafile30 that there is a 16 pins
connector with a full line (8pins) connected to ground and the
others connected to the i8156 (2 // ports + timer). (near the 64K
eprom). I beleive that this is supposed to be used as a configuration
connector, plugging small straps between ground and i8156 line,
but how and what for?

o About software, I don't care since I always use Minix.
(but i beleive that my old AHDI program will not be able to
recognize a new disk)

Thanks for answering me...

>I'm interested in buying minix this summer but I have a few questions:
I was too. So I bought it. $80.00

> - How well does it work in about 10MB of disk space?
Apparently, it will fit with no problem. Of course, there are such concerns
as now much ram your computer has and how heavily you are going to use Minix.

> - Can you read ST disks?
Sure.

> - How well does it interface with a modem, printer and mouse?
You will have to find/write device drivers.

> - How much modification do Unix sources need to compile with gcc under
> Minix?
Got me. gcc takes more ram that I have (I have a 1040st with a meg...)
I would assume that certain programs (comp.unix.sources) would compile
without too many modifications at all. Again, I don't have the ram for gcc.

> - What kind of shell(s) can you use?
I like sh.... but I have other ptoblems with minix-- see bottom.

> - How well does the remote logon operate off the rs232 port?
I wish I knew, but from what I hear, you can get remote logins via
the rs232 and the midi port.

> - How happy are you with the package?
As of yet, not very happy at all.

> - How much does it cost?
$80

> - Where can I get it?

Prentice Hall?

Here is why I posted this:

I sent in my $80.00 and I received ST Minix 1.1. Version 1.1 is ok,
but I started reading comp.os.minix and I soon found out that it
wasn't the latest version. Not only that, but by the time I read an
article in comp.os.minix, a new version had come out. This has
repeated until now, I think... the current version is something like
1.5.10. Of course, there is no standard method of upgrading and from
what I can gather, there is no one place where you can pick up any
upgrades for say, from version 1.1 to 1.5.10.

So, you can order your Minix now and you will probably get an old
version. I thought I heard talk of a new release 2.0 (or was it 2.1?)
for later this year. I sure hope Prentice Hall will accept the old
disks back as part of some sort of upgrade because I have not spent
the time to mess with 1.1 since the newer versions appear to be
sufficiently enhanced to the point where the old version would not be
worth the effort to maintain it.

-This is all pretty comical...
-
-I don't care about ST Report one way or the other.. when there's something in
-it I want to read, I get it from one of several sources that have nothing
-to do with UseNet...
-
-What's really been amusing though is the number of people here who are
-willing to have Greg Lindahl do their thinking for them...
-
-Perhaps we should let him censor our daily newspapers too... that way he
-could just snip out any articles he doesn't think are interesting.. think
-of all the wasted time and reading we'd save by letting him do our
-thinking for us...
-
-Come to think of it, there've been some really boring articles in STart
-at times.. maybe we should let him scissor out those... and the ads too!
-
-I dunno, it sounds pretty scary when people start letting someone else
-think for them...

Right. Which is why I won't begin with you.

Interestingly enough, what Greg Lindahl was doing is something any
manager would appreciate: cut out the b******t, just give me the pertinent
info. Of course, if you have an infinite amount of time, you can read
everything. If you don't, you find a good employee to sift through all the
data, and give you the stuff you really need.

I don't know how good a job Greg was doing; the fact that he was
*trying* to save people time (and, incidentally, obeying the law, something
that I personally admire) leads me to suspect he would be a good
employee...as opposed, of course, to someone who assumes you want every
single detail, with or without regard to the legalities...
I assure you, a good manager does *not* do all of his "thinking"
for himself. He delegates. The essence of good management is to find
people you can trust to do delegated tasks properly, and to report back
what *you* need, and *only* what you need, to do your job.

The fact that he's trying to edit isn't intrinsically bad (after
all, *everything* we normally read has been editted by *someone*, even the
vaunted STreport; what we have here is just a second level of editting);
the more important question is "was he a good editor?". That, of course,
will always be a matter of opinion, based on the goals of the recipient.
```

Does anyone on the net know of a (preferably European) source for
portable, up-to-date, source for UUPC? I am looking to port to the Acorn
Archimedes machines. Is there someone / some group actively looking
after this software?

I know of:

an up to date version for the PC: unportable due to assembly language routines.

An old version for the Atari ST: looks portable but ancient and buggy.

>curious after reading an article in Computer Shopper which mentioned
>both "software blitters."
>
>Any info would be appreciated.

both Quick ST and Turbo ST are almost identical in speed for the system fonts (8 by 16, 8 by 8, 6 by 6), with Turbo just slightly ahead. but the latest revision of Quick ST will now support GDOS fonts, which is something that Turbo ST says right on its package that it does not support! if those few extra percent are worth it for you, get Turbo, but if you like your precious system memory (Quick takes less than half of Turbo's memory), get Quick ST.

plus Quick ST fully supports Moniterm with no special monkeying around with filenames, etc, and it also supports custom desktop backgrounds and fill patterns. as well, Quick ST supplies a few extra utilities which make life easier for the Atari ST (desktop customizer, ART ST graphics software, Quick View)

hope this helps!

>Amiga 3000 in terms of price (the A3000 is under $4000 US).

You get what you pay for. Judging by the specs you give later in the article, the TT does seem to be a significant step over the ST (but I suppose it should for that kind of money), but I really don't think it is a threat to the Amy 3000 or Sun workstations. All of these gadgets that are said to be available RSN (real soon now) for the TT: including PC emulation, Mac emulation, networking capabilities are nice, but based on Atari's previous antics I will believe all that when I see it. BTW, $4000 CDN is only slightly less than $3000 USD. That is the price of the A3000 16mhz machine. However, the A3000 is bundled with a multisync monitor, a 68881, a faster hard drive, and more expansion slots.

This isn't really intended to be a "go out an buy the Amiga, the TT sucks" type of posting, but I'm just trying to point out that the TT isn't really breaking any new ground out there in price or performance areas. 68030 technology has been available on other platforms for quite a while now.

To each his own...I'm sure there are many ST users who will be more than satisfied with the TT, but I don't think it will have the wider appeal of other 68030 systems due to its rather limited expanability and Atari's notorious reputation for forcing users to buy new machines to get higher tech rather than providing a reasonable upgrade path.

For all you ST diehards, flame away. My mailbox is open.

Do not forget that the above includes a great Multisync monitor, AmigaVision
and Wordperfect, all todether. A 1yr. waranty.

To say that the TT gives a 1/3 speed increase to non-030 code is a joke!

On a A2500/030 people get a 8.7-9.2 times the speed of a stock A2000 increase,
it is only larger on an A3000.

And don't forget all the networking cards....

Apple Talk? HAHAHAHAHAHAHAHAHAHA!

The only 'reliable' source was GEnie, CompuServe or the ST-Report mailing list. So, now you'll have to fork over $$ to get an 'uncensored' version.

>And yes, I will remove the commercial advertisements.

Since Ralph Mariano has expressly FORBIDDEN such removal, your remarks about sending out ST Report are stupid. You can't do it, so why bother? This is what I meant by not listening to YOURself.

I wonder if atari will be offering an educational discount for
any of their machines. I'm not sure what the current exchange rate is
but the two machines will probably end up being in the same price
range. With some added memory and running UNIX, this might end up
being a pretty nice machine, especially with all of the UNIX software
that's available.

>

Under CBM's educational discount, an Amiga 3000 with 25MHz '030, '882,
40 meg 11ms HD, and color multiscan monitor can be had for $3039.
The 16 MHz model (w/68881) costs $2599, HD and monitor included.

I see two main advantages the TT has over the 3000, based on the specs you quoted: the 1280 x 960 mono mode and the built-in appletalk. The Amiga with an A2024 mono monitor can do 1280 x 800, which just about (but maybe not quite) nullifies the first advantage. As for the second, lack of a reliable appletalk system for the Amiga does present a problem; however, things like ethernet boards and X-windows have been around for some time, and CBM's own ethernet and arcnet cards, as well as Novell-compatible software, will be shipping shortly.

I hope Atari and CBM both do well with their 030 machines (if only to slow the sales of PC's and Macs :-). At this point though, it looks as if Atari's got to do some hard work to compete well against the 3000.

You get what you pay for. Judging by the specs you give later in the
article, the TT does seem to be a significant step over the ST (but I
suppose it should for that kind of money), but I really don't think
it is a threat to the Amy 3000 or Sun workstations. All of these
gadgets that are said to be available RSN (real soon now) for the

[...]

This isn't really intended to be a "go out an buy the Amiga, the
TT sucks" type of posting, but I'm just trying to point out
that the TT isn't really breaking any new ground out there in

Well I am not impressed with the specifications of the TT, but don't give
me this `amy 300 and Sun Workstations'. Agree that the TT isn't a thread
to the Sun workstation, but compared to the A3000 it should stand a good
chance. The reviews I have seen so far of the A3000 (Byte, c't and PCW) are
not flattering: A multi-media machine with 32 colors :-(
7Mhz graphic accelerator chips :-(
2 wait states fast-ram :-(
Guru meditations :-(

To each his own...I'm sure there are many ST users who will be more
than satisfied with the TT, but I don't think it will have the
wider appeal of other 68030 systems due to its rather limited
expanability and Atari's notorious reputation for forcing users
to buy new machines to get higher tech rather than providing a
reasonable upgrade path.

For all you ST diehards, flame away. My mailbox is open.

No flames, just reasonable unbiased information. I agree on the conclusion
that ST-owners will by TT's, but the same applies to A3000: amiga-owners
will by A3000's.

[...]

>Later this year the tower TT (the TT/X?) will be released. Among other

>Ethernet card, a GENlock card, and a software IBM PC emulator. The Atari GM

[...]

No argument there. The problem is that Atari Corp's record on kept
promises is just plain weak. I do hope they pull it off so I can
unload the 400 shares of Atari stock I bought at 4 7/8.

Well, they make many promises and they launch many computers.
Let's compare:
- Both Atari and C= has a full PC-line (down the drain).
- Atari launched the Portfolio PC, C= well...
- Atari has the 520, 1040, MEGA's & STE, C= has A500, A1000, A2000 & A2500,
draw!
- Atari has launched a portable ST, C= has the portable Am... Ahem, well...
- Atari launched their Transputer Workstation, C= has - what can I say...
- Atari still has to launch the TT, C= has launched the A3000, hurraaa!

UNIX? I believe the TT was running UNIX at CeBit in Hannover, and the fairly
high resolution in monochrome, is a better platform for X-windows, than
4096 colours hold-and-modify mode at a medium resolution. So when it comes
to UNIX, I would prefer the TT (but still more I would like it to use
a 25 MHz 68040 and the Blossom graphics chip).

95. I saw the ST finnally.

Newsgroup: comp.sys.atari.st
Date: 1990-06-05 23:36:24 UTC
From: danb20@pro-graphics.cts.com
Message-ID: <3012@crash.cts.com>
Source record: 240414

I finnally saw, close up, the Atari ST. The guy had an Atari 1040ST 1Meg
and an accellerated Atari Mega-4st.
It looks like a great machine, but what I dislike about it(compared to
Amiga), is it's not built around multitasking, it has even less U.S. support
than Commodore(but that doesn't make a difference), it only has 16 colors(I
don't care that much), and it's sound is only 3 mono voices. So the only bad
things I see really are its poor sound, non-multitasking centered, and
necessary proprietary monitors.
What I really like about it compared to a stock Amiga: It was much faster
and managed memory a little better(Than again, he was running a 68000 at
16MHz, while my Amiga only runs a 68000 at 8MHz, he had 4 Meg RAM, I only have
2.5 Meg), and it has a program that seems to blow away all Amiga 3d graphics
programs for speed and user interface: CYBER PAINT.
All in all, it was nice to see another minority in the majority IBM world
and I was glad to see that the Atari ST really is a serious machine and not
just a 'game machine.'

96. Questions about hardware

Newsgroup: comp.sys.atari.st
Date: 1990-06-06 02:01:38 UTC
From: n8742883@unicorn.WWU.EDU
Message-ID: <1039@unicorn.WWU.EDU>
Source record: 240415

I am thinking of purchasing spectre GCR to emulate a MacIntosh on my Atari 1040ST. I believe that the GCR cartridge is capable of allowing the Atari's internal drive to read Mac disks, and that (most likely) a second drive is needed as the Mac needs one drive for its system and finder disk, and a second drive to run the application.

I would like to buy a hard drive for my ST to use for both my ST and the Mac Emulator. Looking in the most recent issue of STart (7/90), a mail-order firm named Computability is selling a 49 Meg Segate hard drive for an incredible $295! Is this price for real (i.e. no "additional" hardware is needed for the drive), and has anyone out there had any problems with the Segate drives? The next lowest price offered by any other hard drive manufacturer is Supra, which is selling a 30 Meg drive for $499!

My other question deals with the Spectre GCR: I have never seen this product in action, and I am wondering if anyone out there has had any experience with this emulator-- either positive or negative. Would Spectre be able to run off of the Segate (or any other) hard drive without too many problems?

Thanx in advance,

Perry Pederson

>(2Mbytes, 40M hard disc) is under $4000 (CDN). This puts it well under the
>Amiga 3000 in terms of price (the A3000 is under $4000 US).

I assume that the 4000 dollar price was list/no educational??
I guess it about time, but if the price is reasonable, I will buy it
because its a helluva lot cheaper than a base 16Mhz IIcx.

> The presentation I was at was for Ontario educators. Earlier in the day
>there were presentations to the press, developers, and user's groups. Some of

As an Archimedes owner I have a little problem that I would like some
help on. I am working on an Atari Screen Convertor that will take Atari
bitplanes and display them on the Archimedes computer (Obvious huh?).
The difficulty I have is with Degas Compressed Pictures. I have noted
that if the first byte has its top bit set (ie a value of &80 or above)
then the file is compressed. What I need to know is how are the bit
planes packed? It does not appear to be run length encoding as that
seems to produce too many pixels.... Any help on this would be
greatly appreciated as well as any other screen formatts that you
know of (I am trying to make this a useful converter!) I can already
convert Neochrome and uncompressed Degas pictures.
Please reply via email to ST131BAP@vuwst2.vuw.ac.nz. Do not post
as I do not think this will be of much interest to regular readers
and I have problems keeping up with this news group.

Thanks in advance,
Philip Banks.

In reply to Greg Lindahl...

I think you were doing a real service to the members of the UseNet community who have no other source for the online magazines by maintaining an E-Mail mailing list...

What I object to is your changing the content of the publications to suit your own tastes.

When you delete "paranoid ravings," you impose your own tastes and opinions on everyone who eventually receives the censored version, and who will never have the opportunity to make up their own minds.

If my mailman was a Republican, and was allowed to censor my mail and magazin I'll bet I'd never see any articles about Democrats...

>I guess your idea of a newspaper is some sort of service where anyone
>can submit any article they want, and the newspaper must print it.

No, the idea is called "Freedom of the Press" where publications are guaranteed that they *won't* be censored as you were trying to do... whether you like it or not, that's the way we do things in the U.S. of A...

As far as running the mailing list, I'm far too busy supporting local Atari user groups... it's ironic how many "Atari Bashers" are actually heavily involved in supporting Atari at the grass-roots level, while most of the "Atari Cheerleaders" are not...

If you want to do a service to the UseNet community by forwarding online magazines, more power to you... it's a great idea, and you deserve a lot of respect for putting in the time and effort to do it...

If you want to censor the content of what you're passing along, forget it...

BobR

>distributed with the ads over the net...By removing those ads and
>distributing them greg was doing a service to the ST community, making
>more info available. He should have gotten permission of the author
>first mind you, but other then that there is nothing wrong with what
>he did.

Chris, if indeed private E-mail over UseNet is barred from containing
anything of a commercial nature, then *with permission*, removing the
ads before sending the online magazines out would be a true service...

But removing "paranoid ravings" or "things unrelated to the ST" is not...
that's subject to the opinion of the censor.

There's a big difference between the editors of a newspaper selecting which
stories to cover, and someone like a government agency coming in with a
big black marker and blanking out stories they don't want you to read.

The first is called editing, the second is censorship...

If Greg wants to create his own publication, then he can "edit" it in any
manner he wants to... but as "custodian" of a mailing list for an existing
publication, he has no right to change the content of that publication.

I agree that he should have gotten permission to change ST-Report before
he did so... probably that's why it's spilled over into the public...

>
>I dunno, it sounds pretty scary when people start letting someone else
>think for them...
>
>BobR
Come on Bob. Everything you take in has been editted in one way, or
another. If you get news from TV, some editor has decided what gets
shown, and what doesn't. Newspapers and magazines have editors as
well. Even your own sight and hearing have been editted by your
own physical limitations. Greg was not thinking for other people,
he was doing two things. He removed advertisements so ST-Report
could be transmitted over the network, and he removed articles that
were either duplicates, or non ST related. He added his own editorial
comments, but that could hardly be misconstrued as withholding
information. If you really think that Greg was trying to do all
the thinking around here, I think that maybe you should ask Greg to
do some thinking for you, so that things can be set straight in your
mind.

105. Problem with Lattice C v5.04.00 Install - FOLDER??? BUG

Newsgroup: comp.sys.atari.st
Date: 1990-06-06 09:42:00 UTC
From: gossa@rdge44.enet.dec.com
Message-ID: <198@uninet.vbo.dec.com>
Source record: 240445

I have a strange problem installing the new Lattice C compiler on my
65meg TCT hard drive. (I have a 520STFM expanded to 1meg).

1) If I do a minimal installation (about 1.5megs) Then everything is O.K

2) If I go for a full istallation (5meg spread over 7 DS floppies) Then I get
strange errors like the program LC.PRG is unable to create intermediate files
and GO.PRG,LC2.PRG and CLINK.PRG crash with various amounts of bombs.
Recopying the files from the floppies seems to cure the problems, but it then
has errors linking (I think the floating point library is corrupt).

Could the problems be due to the 40 FOLDER BUG??. I'm running ICD BOOT
v4.6.0 which says it includes a fix for this and I set the number of extra
folders to 200.
if I run DLII it reports no cross linked or lost sectors but does complain
about the directory structure being bad. DCDEMO.PRG complains about garbage
characters at the end of the directory tables.

Does anybody have any experience with Lattice C v5 or ICD's software v4.6.0
and could some kind person mail me a good description of the 40 folder bug.

Thanx in advance

- Andrew -

106. Add 2Mb of memory in your MegaST2

Newsgroup: comp.sys.atari.st
Date: 1990-06-06 09:53:18 UTC
From: ciceron@chorus.fr
Message-ID: <5388@chorus.fr>
Source record: 240420

I was fed up with seing messages like "out of memory", "not
enough memory" with my Mega ST2. Ok, this happens under Minix (sorry,
I never use GEM). Then I decided to add 2Mb of memory to get a Mega ST4.

How to do the upgrade:
======================

o buy 16 ram chips 411000 (1Mx1 dynamic rams). The speed is
really important. 100ns should be enough but don't play with
races. I took 80ns for mines.

o buy 16 I.C supports for the rams.

o buy 16 small capacitors of 220nF each. Try to get the same
space between pins as on the board, it'll be easiest to
solder them. Do NOT omit/forget theses capacitors.

o buy/get 3 resistors of 33 ohms. Theses resistors are used to
connect the CAS, RAS and RW line of rams to the output driver
LS373. Basically, dynamic rams have null input current (less
than 10 uA), so that you could get another resistor value.
However, theses resistors are needed for waveform
considerations (I beleive).

o now begins the most difficult task. Get a (un)solder pump or
something like that and unsolder the holes where the rams go.
You must be careful. If you have no experience on such
operation, do not do that. In fact it's quite easy (I have a
some experience of unsoldering double sided board), it's quite
easy because holes are empty. That is, there is no component
attached to them, yet.
Start unsoldering the lower board (no component on that side)
and then the upper board. Holes must be empty.
If a hole still remains full of solder (or solder in the
middle), fill it with new solder and then retry. The board is
quite robust, but do not do that do many times.

o Still there? Now sold the 16 supports. DO NOT SOLD MEMORIES.
First because you may damage them. Second because you cannot
unsold components (you'll damage the board and connections).
SOLD SUPPORTS.

o sold capacitors and resistors.

o Now, do not plug memories on their support. Check that your
computer is still alive.

o Plug one chip, and test your computer. The atari will not
recognize it but this is a test.

o Plug 15 other rams and check your computer.
If everything goes well, the atari recognizes the new memory
bank.

Power supply:
=============

No problem if you upgrade a MegaST2. The MegaST4 has the same
power supply unit as MegaST2.

Testing memory:
===============

Testing memory is a very simple task. Here is a simple exemple
on how to test memory. Basically, the program checks that all bits of a
byte can get the value 0 and 1.

```
register char *p
register char c;

p = 0x0800; /* First address in not-protected space */
while (1){
c = *p; /* Get a byte */
*p= ~c; /* Toggle each bit and read it again */
if ( *p != ~c ){
printf( "Problem at %08xl [%02x]\n" , p , *p ^ (~c) );
break;
}
*p = c;
if ( *p != c ){
printf( "Can't set old value at %08xl\n" , p );
break;
}
p++;
}
```

Oops!! I forget to say that you cannot test the memory where
your program is (known as self code modification).

Well, if you can't write a test program, don't worry, and
remember that the Atari uses the last 32K bytes of memory for the
screen. (if the desktop appears on the screen, you are safe!!)

If you have a st520 and you want to add memory, just to the same
things but replace 411000 by 41256. You cannot put 1Mb memories.

Good luck!!

>the time to mess with 1.1 since the newer versions appear to be
>sufficiently enhanced to the point where the old version would not be
>worth the effort to maintain it.

Scott, you did NOT get an old version. The one and only version
currently available is ST 1.1. This version is close to the PC 1.3
version. I did the upgrade from ST 1.1 to PC 1.5. Since my upgraded
version and PC 1.5 are compatible, we decided to call this new version
ST 1.5. ST 1.2, 1.3 or 1.4 were never distributed!

The upgrades to go from ST 1.1 to ST 1.5.10 have been posted in
comp.os.minix. If you want to upgrade you can use the posted upgrades
(although this is not trivial). As an alternative you can buy
ST 1.5 from Prentice Hall. It will be available late summer, and
will consist of 10 disks and a 750 or 800 page manual.
I do not know the exact availability or price, so please dont ask.
watch comp.os.minix for the announcement.

To conclude: late summer will bring 1.5 versions of minix for PC, ST,
Amiga, Macintosh and I believe some PS/2 systems.

If you do have ST 1.1 and you want to upgrade you have 2 options:
- wait until summer and buy ST 1.5. You might get a discount
if you have bought 1.1. I'm not sure though
- upgrade using the posted diffs

The fact that the diffs are posted, while you cannot get the stuff
from PH yet, is that PH needs time to manufacture disks, print the
manual etc. Also the net postings serve two purposes
- to be a service to the minix community
(which other product offers you upgrades over the net?)
- to get feedback about new releases before they are shipped, so we
can make a better system.
So the knife really cuts at two sides:
we get early bug repots, and you can upgrade early.

happy minixing,

>

Would someone please start quoting REAL prices for C= machines? Not
everyone qualifies for the educational discount. Under your reasoning,
it could be said that the Atari TT only costs $2000 CDN under the Atari
Developer's discount. And, for that matter, WordPerfect is $99 under
student discount, but $299 list. Don't fudge figures.

Source record: 240442

>6 Jun 90 02:01:38 GMT n8742883@unicorn.WWU.EDU (Perry Pederson)

I *HIGHLY* recommend the Spectre GCR. It works great & lives up to all it's advertising copy. (A rare occurance -- especially in the computer industry!!) The GCR does (with a little fiddling) allow *MOST* ST drives to read & write Mac disks directly. It depends on your ST & which drive Atari put in it when it was manufactured. (I'll post more detailed info on this tomorrow when I can bring my manual in).

You don't *require* a second drive to run a Mac but unless you like to swap *LOTS* of diskettes I recommend you get a Hard disk drive.

Positive results w/ the emulator
- Mac Write
- Microsoft Word
- Microsoft Excel
- Mac Draw
- Super Paint
- HyperCard
- Various Init Docs (On Cue, Pyro, Suitcase II, etc.)

All these programs work flawlessly in Mac emulation mode.
I had trouble with a chess game (?title?) and an adventure game (?title?).
Also, sound emulation is weak (I don't have the latest update of the software).

Last but not least **SUPPORT FOR THIS PRODUCT IS GREAT**
Dave Small takes a personal interest in keeping this product on the 'edge of the envelope' (his words -- not mine). Software updates are available on Genie! and possibly Compuserve.
Phone support is excellent (Talk to Dave directly) and when you do have to leave a message on the answering machine -- he calls back promptly.

Tyler

Disclaimer: The Ohio State University doesn't know (or care) about my opinions and neither should you!

PS. Any HDD which works with the Atari should work w/ Spectre. You just assign 1 or more partitions to the Spectre during installation of the emulator. I will post the phone number for Gadgets by Small ASAP.

I'm getting sick of having to wade through all of these stupid posts. Today, there were 30 new articles in c.s.a.s., about 10 of these were people blabbering about "censorship of ST Report", I'm sure lots of people, like me, are sick of this garbage, and Greg said he discontinued it anyway, so WHY are there still posts? There were also to articles with the header "Atari TT launched" and the body of most of these articles contains stuff about the Amiga. Isn't there a newsgroup for the Amiga? I'm getting sick of reading through all of this garbage.

If you insist on posting stuff about the Amiga, PLEASE put the word "Amiga" in the subject line so my kill file will save me the aggrivation of having to wade through it. If you are going to post about "censorship of ST..." please put the words "pointless ravings" in the subject line.

Have a nice day,
---jb

I'd like to clarify something I said in my earlier post. I said that the TT 030(under $4000 CDN) was cheaper than the A3000 (under $4000 US). Please keep in mind that $4000 CDN translates into about $3200 US.

On the topic of educational discounts from Atari...

This issue was brought up many times during the course of evening. Atari Canadacan offer their PC's at educational prices (because they are Ministry of Ed approved), but only by going through the tender process. Individual discounts go through dealers and if Atari have a policy I did not hear about it.

Travis Capener

> allowing the Atari's internal drive to read Mac disks, and that

The MAC and ST are M 68000 based computers. Spectre utilizes the MAC
OS ROMS, and patches in changes for machine dependent features (like the
screen). The result is an 8 Mz MAC with a larger screen.

1. Spectre 128 is the software.
2. Spectre GCR includes a device to read MAC floppies on the ST drives.
This requires roughly 1.44 MB performance from the ST 720 K drives.
Most of them work ok. Some don't.
3. Spectre, like a MAC works best if there is a hard disk. All ST HD are
almost the same, so there is little problem of compatibility.
(Re: MINIX: not as much compatibility!).
4. The result is BINARY. A MAC program either works (perfectly) or not
at all. Most of the useful ones run.

[DELETED]
> I hope Atari and CBM both do well with their 030 machines (if only to
>slow the sales of PC's and Macs :-). At this point though, it looks as if
>Atari's got to do some hard work to compete well against the 3000.

I don't know about other people... but when I shell out hundreds of
dollars for software this year, I will not likely want to throw it
away next year. The advantage that the TT MAY have over the CBM
machines is that it will still run old Atari ST/8bit software.

Yes, I get sick dreams of an Amiga with the ST emulator card running
some bastardized Spectre MACulator gadget running some hacked IBM
emulator running a another emulator.... etc.

My personal opinion is that you need to buy a computer to do something.
If the computer you bought does what you need, then it was a good purchase.
If the computer you bought does not do what you need, it was a bad purchase.

My ST does what I want. At one point I had some 500+ Atari 8bit
disks. The ST was rumoured to run some 8bit stuff. The price was
also right. Perhaps the Amiga did have, at that time, 50% more
colors-- I already had a software base. Now that I have an ST with a
bunch of software, it will take a lot for me to throw it all away and
switch to a computer that I know nothing about, and that is ANY
computer, not just Amiga.

Does it really matter which computer is better when either will do what you want?

With the way computer technology is advancing, I seriously doubt that
I will spend MY money to buy another computer until at least
1993-1994. The minute you buy something it is old technology-- and I
know this will always be true.

At one point the old-technology of the future will be significantly
advanced compared to the technology of that past that you are using--
and that is the time to buy...

I am tired of seeing Amiga is better/cheaper. Great, sue me because I bought an ST and I like the machine that is worse and more expensive.

If you think about how little we actually know about all of our machines and how little we actually use their potential, you will see that all of this machine comparison and bickering is a useless waste of time and we should be spending our time hacking our machines instead.

Scott
ps: enough on the ST-report-scam thread, it's dead.

>increases were with non-030 applications (ie those written for the MC68000).
>I seriously doubt your claim that a ~9-fold increase was achieved on the A2500
>WITHOUT optimizing the code towards a 68030.

That wasn't mindless ravings. Seriously, that 1/3 number confuses me--it should be lots higher. Going from a 16 bit to 32 bit machine and doubling the clock speed (8 MHz to 16 MHz) should give you at least a factor of 4, and then some because the '30 takes fewer clocks to do some things. There aren't that many new opcodes or addressing modes for the '30, so the speed increase from recompiling for a '30 should be relatively small (unless you're doing lots of floating point, in which case the coprocessor gives you a whopping big factor).

Serious question--why is it so small? Is that 1/3 correct? Do they have to do something ugly for backward compatibility, like turn off all the caches and force the '30 to do 16-bit accesses unless the program says that it is '30 compatible?

Finally, the TT probably should be compared to the 16 MHz A3000, since the TT is 16 MHz. List US price for a 16 MHz A3000 with 2 Meg RAM, 40 Meg hard disk, 68881, and no monitor, is $3300 (US). 25 MHz A3000 is $4000 US, which is probably what the original poster was thinking of.

For what it's worth, Atari AND several developers were showing the TT030 at the Atari Show in London on June 1-3. The base price for a 2mb/40mbHD version, including a VGA-standard colour monitor, was said to be 1995 pound (+15% value-added tax).

They said it will be out there after July, but we all know what that means.

I am not sure, but I think TeX requires more than 1 meg to run. I have only tried the old version so I am not sure about 3.0. The old one seemed happy on my 1040ST with 2.5megs RAM. Also, it is a real bear to use without a hard drive.

Hope this helps...

Can anyone send me PINHED16, the latest version of Charles Johnson's program to speed file loading? I've just got a shiny new STE (2 meg! Lovely.) and PINHED14 doesn't recognise the TOS 1.6 ROMs. I know I could use MAKEFAST to set the fast-loading bit for each program, but I've read that PINHEAD is more flexible and I'd rather have fast loading as the default rather than have to set each prog separately.

BTW, has anyone else with an STE found that using ctrl-alt-undo within NeoDesk to force a cold boot results in 2 bombs? It might just be one of my AUTO progs or accessories that's to blame, but I've tried removing most of them and still get the problem. ctrl-alt-del for a warm boot in Neodesk's OK, as is ctrl-alt-rightshift-del for a cold boot outside NeoDesk.

Graham

>comp.sys.atari newsgroup to make sure noone's saying bad things about the
>Amiga. half a ;-).

Just for your info, the A3000 25mhz,68882 machine RETAILS for $3995.
That is only slightly higher than the price quoted for the TT. As
noted earlier, the price is $3000 with a educaitonal discount.
I think I wouldn't mind paying a little extra for the better math
coprocessor, faster bus, and faster 68030.

I think many Atari and Amiga owners read both groups since the machines
are very similar, I suspect they both attract the same crowd. I know
a few people who have both machines.

....
> I dunno, it sounds pretty scary when people start letting someone else
> think for them...

Other than cutting out advertisements and some non-ST articles, the only thing Greg ever did is add a few of him own comments that were clearly marked like this:
[sounds way off base to me -- gl]

Never did such comments affect or substitute my thinking for myself in regards to the article. The only question is whether you want everything to be left in your copy of ST-Report. Personally I perferred the way Greg did it; I didn't have to skip over them myself.

>should be lots higher. Going from a 16 bit to 32 bit machine and doubling
>the clock speed (8 MHz to 16 MHz) should give you at least a factor of 4,

How do you figure that???? I would expect a CPU with twice the clock rate to execute instructions twice as fast. However, the difference between a 32 bit bus and a 16 bit bus will not double your execution speed (unless every single instruction in the testing program operates on 32 bit objects). Sure there will be more speed improvement, but definitely NOT enough to double the speed.

You can always whip up some special optimal program that will run 4 times as fast with the above configuration. That is, if you just want to impress those people that like to say "MY machine does more Giga-hoozits than..." In real life, though, it don't work that way. I still feel that the most important and effective things you could possibly do to speed up your computer is to learn how to type and operate a mouse faster and get a faster hard drive. Even a ZILLION-MHz machine is gonna twiddle its thumbs waiting for you (operating at about 3Hz) to tell it what to do.

>real bear to use without a hard drive.

The older TeX versions didn't require more than 1 meg, but they were so large that you couldn't run gulam and TeX at the same time. That's why I wrote TeXShell -- it's a graphical shell for running TeX which is small enough to allow you to TeX on a 1 meg machine.

Of course, TeX's memory requirements depend on how big you make all the internal data structures. It may be that TeX version 3.0 has increased the size of these, so it won't run in 1 meg at all. However, you should be able to get it to run inside of 1 meg by making the capacity of various things smaller.

>Chris, if indeed private E-mail over UseNet is barred from containing
>anything of a commercial nature, then *with permission*, removing the
>ads before sending the online magazines out would be a true service...

Private email over the Internet has this restriction. If not, someone
could email thousands of advertisements from portal all over the world
for essentially free. Nope.

>There's a big difference between the editors of a newspaper selecting which
>stories to cover, and someone like a government agency coming in with a
>big black marker and blanking out stories they don't want you to read.

Listen, Bob, I didn't stop ANYONE from getting anything. Anyone else
could have set up a mailing list and mailed whatever they wanted out,
as long as the advertisements were removed. That's why it's editing. I
have the *FREEDOM* to not be forced to mail out bullshit I don't agree
with. You have the *FREEDOM* to mail out the bullshit, if you're
willing to spend your time.

>I agree that he should have gotten permission to change ST-Report before
>he did so... probably that's why it's spilled over into the public...

The law isn't on your side. And this is my last posting on the topic,
as there is nothing more to be discussed.

- The ST-Report mailing list is dead.
- ST-Report cannot be mailed over the Internet, given its current
copyright restriction and advertisements.

130. Can we avoid speculating until the TT actually ships, please?

Newsgroup: comp.sys.atari.st
Date: 1990-06-06 21:27:10 UTC
From: gl8f@astsun.astro.Virginia.EDU
Message-ID: <1990Jun6.212710.15236@murdoch.acc.Virginia.EDU>
Source record: 240351

The TT is not yet shipping. Until it does:

-- we won't have good benchmarks.
-- we won't know what the street price will be.
-- we won't know what is bundled with the machine.

All of the current speculation is useless until it actually ships. So
can we *please* stop talking about it until we have something hard to
talk about?

Thanks.

>OF course it's nice to have 4M as minix has no virtual memory, but

Disclaimer: I do not claim to know much about the ST architecture but...

I was wondering if there are ANY (preferably transparent) programs out that will enable an ST to use its hard-drive as a source of virtual-memory: As long as the software you are using doesn't need to skip all over memory while it is running, this sure would be a nice way to give yourself an 8-meg machine (4meg chipped + swap 6meg or so [leaving 2meg for system,etc]) or some other exotic memory size by utilizing the memory storage most people already have. Or even give someone with a 1meg-machine 4meg of useable memory. Of course by using certain replacement policies you can speed up what could be excruciatingly slow, but for some programs like word processors, I can't see that it would slow it down that much if most of what is in memory (pages of information) were read into the ST in bursts.

Would this be so impossible? Or have I been hitting the caffeine just a little too much ...:)

133. New MM/1 OS9/68000 Computer

Newsgroup: comp.sys.atari.st
Date: 1990-06-06 22:38:06 UTC
From: knudsen@cbnewsd.att.com
Message-ID: <1990Jun6.223806.15942@cbnewsd.att.com>
Source record: 240436
Cross-posted to: comp.os.os9,comp.sys.m6809,comp.sys.amiga,comp.sys.atari.st

Here is a more info on the new 68K OS-9 machine,
from DL area #15 on the CIS OS-9 SIG.

"OS-9/68000 selected as official operating system for
multimedia computer"

Today Mr. Paul K. Ward of Interactive Media Systems, Inc. announced
that the IMS multimedia computer product, the MM/1, will use OS-9/68000
as its operating system.

"We're proud to announce that OS-9/68000 will be bundled with the MM/1.
We strongly believe that OSK will be chosen more and more often as an
affordable alternative, and Microware is happy to see a new
personal computer that uses its operating system."

Microware Systems Corporation of Des Moines, IA, is the creator and
licensor of OS-9/68000 and its sister product, OS-9000. These operating
systems help the computer user and his software to communicate with the
computer hardware. OS-9/68000 is also known as OSK. It is used for
robotics, data acquisition, multiuser systems, and software development,
among other uses. It has similarities to the popular UNIX operating
system, but is much smaller, less expensive to operate, and is generally
considered more responsive.

"Having OSK bundled with the MM/1 will make it a little more expensive,
but we believe that OSK is the multitasking operating system of the
future for dollar-wise consumers. And since OSK is used in multimedia
applications, we thought it was best suited for our multimedia computer,
the MM/1."

Projected price for the MM/1 is $779, including operating system, text
processor, user guides, and several surprises. "I think that our
competitors at Commodore and Atari are going to sit up and take notice,"
said Ward. ^^^^^^^^^ ^^^^^

Ward added, "We are bundling Microware's Basic and its C compiler with
the computer. We're looking forward to our customers being a steady
source of interesting and innovative software products. Naturally,
these will use the unique capabilities of the MM/1, including
multimedia, high-speed graphics, and multitasking windows."

Interactive Media Systems, Inc. was established in North Carolina and
is dedicated to small multitasking computer systems for office,
education, and home use.

For more information, please call 202/232-4246.

[Disclaimer: Poster has no connection with IMS other than interest in their system.]

>read into the ST in bursts.

This seems to be impossible on a plain ST. A paged virtual memory system
automatically implies page-faults - traps generated by accessing a virtual
page that isn't currently in real memory. First there's no straightforward
way to distinguish a virtual address from a physical address. This is pretty
much essential, that is, you must be able to keep the two distinct. Second,
assuming you have some way of recognizing an access to a virtual address,
and generating a page fault if the corresponding page isn't in physical
memory, you can't reliably restart the instruction that caused the fault to
occur. (This is *really* a problem if you fault while accessing a memory
mapped I/O device, but we'll leave that alone for now...) Before the advent
of the 68010 with VM support on the chip, there were one or two 68000 based
Unix systems on the market. I think Sun & Apollo used custom designed MMUs,
which probably suspended the CPU in lieu of interrupting it. This implies
that the VM management was handled almost entirely in hardware, with no input
from the OS. Another approach was to use two 68000s running in parallel. On
a page fault, one 68000 is suspended, the other traps & does the necessary
VM magic, the suspended processor is resumed, and the 2nd processor re-syncs
at the following instruction.

So... Unless you can add in some whiz-bang hardware, I don't think you can
get away with it. And even if you can, I don't think it'll run very quickly,
but that's probably not important. The main thing is, you can get better
performance using a chip that was designed to handle VM in the first place.
(68010 on up. 68020 would probably be minimum, though I *think* you can use the

PMMU with the 68010.)

Well that $295 for a 49meg Seagate hard drive is an amazing price. In fact I doubt that dealers can buy them at that price... That is what makes me suspicious about this ad. If you want to connect a SCSI or IBM MFM type d you will need to add extra hardware, there is no ands, ifs, nor buts about it You will need a host adapter, a power supply, and a case to put it all in. Most hard drives you can buy through ST sources only carry SCSI drives so yo the above is all you should need. Seagate make pretty good drives - usually. If you put one together yourself you might save a little money, but not much, and it would probably be easier to just by a Supra or ICD hard drive. (or one by another company (not Tech-Specilities though), if they use the ICD Host Adapter.)

I put together my own 20meg, and it ran me about $450 (using used components) and 2 dead Host Adapters (killed by my own hand - but dont tell ICD), and some large headaches....

>speed.

My "double the bus width, double the speed" was a bit glib. I was assuming that the TT has a decent 32-bit memory subsystem, and that the instruction and data caches are enabled. If those conditions are true, then a '30 should have at least a factor of two advantage over a 68000 of the same speed. If you turn off the cache, that drops. If you turn off the cache and force it to use 16-bit memory, a '30 may well perform worse than a 68000 at the same clock speed.

It is true that, in general, a 32-bit bus machine isn't a priori twice as fast as a 16. However, with the built-in 256-byte instruction and data caches and a pipelined architecture, a 68030 in practice is at least that much faster than a 68000, if it has decently fast 32-bit memory to talk to.

>You can always whip up some special optimal program that will run 4 times
>as fast with the above configuration. That is, if you just want to impress
>those people that like to say "MY machine does more Giga-hoozits than..."

Yeah, but I'm not talking about special cases. On generic 68000 integer code, with decent 32-bit memory and both caches enabled, a '30 should be more than twice as fast as a 68000 of the same clock speed. If we give Atari the benefit of the doubt and assume a competent hardware design for the TT, then it should be at least 4 times as fast as an 8 MHz 68000 running generic 68000 code. I'm just curious why they might not get this running ST applications.

Anyway, as has been pointed out, we don't have real specs or benchmarks for the TT, so this line of discussion is premature. I'll shut up now until some real specs are out.

> folders to 200.

I have the 40 Folder fix set to 100. No problems encountered yet.

As I understand the problem, TOS 1.X has an internal pool of memory
which it uses. The initial memory reserved for this purpose was not
sufficient to hold all the necessary data under certain conditions.
One of the conditions arose when 40 active folders were encountered.
From discussions in this news group, I have learn't that there are
other contributing factors to the reduction of the initial memory
pool, for example when a application uses malloc frequently.

All I can suggest is that you try using the Folder patch instead of
ICD's in case it is not behaving properly. Also check that you have
correctly set up the environmental variables. Failing that try
contacting your supplier of Lattice for advice. I could not tell were
your posting came from, but HiSoft in England are the distributors
here, and they do read this news group occasionally, any advice HiSoft.

Good luck

Chris....

>should be lots higher. Going from a 16 bit to 32 bit machine and doubling
>the clock speed (8 MHz to 16 MHz) should give you at least a factor of 4,

Doesn't the 68030 have internal cache memory and pipelining? I took a look in a 68030 reference manual and some (non-register direct) addressing modes are given as taking ZERO cycles to evaluate. This, of course, is because of the pipeline. If you think about it, then a machine running and twice the speed of an 8MHz 68000 with twice the data bus width and assuming that the memory will run with zero wait state (I don't know if the TT does) then you are looking at everything running at least twice the speed by default. That figure shouldn't even take into account the 32-bit bus which would further increase the speed. The cache and pipeline will further increase the speed.

At the end of the day, you're looking at one SWIFT machine! As someone else said, though, let's wait for some REAL benchmarks before we over-state the acceleration and maybe end up a little disappointed. After all, the new TOS might, for example, disable the internal cache. The new RAM might be slower than it could have been. I don't know... do you?

Oh yes, I almost forgot the most important message:
+ My Atari 800XL is better than your Commodore 64 because it's mine.
+ My Atari ST is better than your Commodore Amiga because it's mine.
+ If I get an Atari TT then will be better than your Commodore Amiga 3000 because it will be mine.

I have a friend who owns a 64 and an Amiga and he uses the same arguments against me. Don't try to camouflage your argument with technical specs, prices or software surveys. This is a religious argument and has been since time began (ie when the 64 and 800s came out). Everyone knows which machine is the best... THEIR machine. If ever they lose faith then they buy a new machine. But that's between them and their own religion. Please don't push your faith on me, I don't want to know.

Religious wars never end... Ever.

Dave.

146. ICD Hard disk formatting and the STE

Newsgroup: comp.sys.atari.st
Date: 1990-06-07 10:10:09 UTC
From: ee86jjw@cc.brunel.ac.uk
Message-ID: <1580@Terra.cc.brunel.ac.uk>
Source record: 240376

I've recently replaced my old ST with a new STE. Upon hooking
it up to my hard drive everything worked fine until I wanted to alter the
hard disk partitions. I have found that my version of the ICD format utility
doesn't seem to work with the STE (I have an ICD host card). I have version
4.2 of the program (ICDFMT.PRG). Does anyone have a version that does work
with the STE's? If anyone has any other upgraded ICD utils for the STE I would
be very grateful if they could for forward them to me.

Thanks in advance,
John.

Spectrum displays use tight, and precisely synchronized timing loops to change
the color registers on the fly as the picutre is displayed. The first set of
16 colors is loaded as the raster is in the overscan area, and is
set prior to the first pixel on the line. Then, as the raster traverses
the scan line, the registers are continuously being loaded. One register
changes each 10 pixels, as I recall. Any software attempting to deal with
a spectrum file must, therefore, keep itself in synch with the current
values of the registers as it works through the scan line, and trrough
the picture.

The top line is always blank, and used to synch up the registers with
the timing loop. The remaining 199 lines get the sets of 64 pallette
entries each.

I have a version of perl running. It's about 250 kB large and was compiled
with GCC V1.37.1. It passes almost all tests. I am still having some problems
with it:
- command output substitution within backquotes (like: `echo hello`)
does not work
- fork/exec/pipe do not work (no surprise :-)
- Carriage Returns at the end of line lead to an error "illegal
character (015) in file ..."

I guess it won't be late (1-2 years at most) before it will be re-promised
I don't know how it will be call then though...

Seriously, the only reason I think that it may eventually come out
is that ATARI has nothing whatsoever to do with it (except of the label).

Thinking of the people who needed 4 years to fix a couple of bugs in TOS
trying to comprehend the complexities of a multiprosessing multiptocessor
operating system is quite hilarious actually :-)

From: jfbruno@rodan.acs.syr.edu
Message-ID: <3666@rodan.acs.syr.edu>
Source record: 240373

Thanks to those that responded to my earlier request for TOS on disk. Nobody knew where to get it, so I ordered the ROMs for $80(US) from:

Toad Computers has both 2 and 6 chip sets of TOS 1.4 ROMs for $80. The address is

Toad Computers
556 Baltimore Annapolis Blvd.
Severna Park, Md. 21146
Phone No. (301) 544-6943

Hopefully, all of my software won't die when I pop in the new chips, we'll see, I really need the hard disk speedup code since I'll soon be getting a SyQuest.

Not really, becase at 16 MHz, an uncached system is no longer zero-wait,
unless you use 60ns DRAMs, which I doubt these machines will use. Am I
wrong about this? I'd like to know for sure.

Well, there are some good benchmarks... Darek Mihocka just uploaded to GEnie his report on benchmarks he ran on the TT at it's Canadian unveiling. (Sorry, the report carries a copyright notice so I cannot post it!) However, I think it tends to support the comment regarding a 1/3 speed increase for non-recompiled code. Apparently, this performance is projected (by Atari) to improve as the TOS on the TT is optimized.

158. Graphic Satellite Tracking Program Update

Newsgroup: comp.sys.atari.st
Date: 1990-06-07 21:54:25 UTC
From: logajan@ns.network.com
Message-ID: <1990Jun7.215425.27274@ns.network.com>
Source record: 240379

I have just released version 2 of my graphic earth satellite tracking program. It is available either in GFA Basic 3.07 source, or it is available pre-compiled and ready to run on any ST class computer.

It is available as we speak on terminator.cc.umich.edu in the applications subdirectory of the atari directory. Two files exist -- norad.arc and noradsc.arc. Noradsc.arc is the source code listing, norad.arc is the compiled version.

I also sent it to the comp.binaries and comp.sources.atart.st moderator, so it should be distributed thru those channels in the near future.

Brag on --

It is so cool to turn on the local radar mode and watch a mess of satellite trails develop all around your location.

Brag off --

Facts on --

This program supposedly is giving you true and CURRENT real time info. However, although it has been compared against a few other satellite prediction models, it's predictions do not always with those other models. The proof is in the pudding however. I have never actually seen a satellite as predicted by the program. I do live near city lights and I didn't spend a great deal of time looking, nor did I have an accurate method of determing which direction and angle I was looking at. So I guess this is a plea for verification from you all.

Facts off --

Source record: 240380

Oh, by the way, the reason for the version 2 release of NORAD (the earth artifical satellite tracker) are:

1.) To fix a 60 minute discrepency in the sidereal time determination (blush) of version 1. This tended to put satellites 2/3 of the way around the world of where they should have been. (sorry, it slipped in at the last second and only took me half a year to discover -- hee hee)

2.) To add a check for sunlight/in-shadow. This tells you if you have any chance at all of seeing the beasties.

3.) To add local radar mode -- which gives an instant visual indication of what's above the horizon, and in which direction to look.

The ATW is, as far as I know, available in the UK (it's just not being marketed very well, but that's par for the course). The hardware side of Perihelion, which did most of the ATW development, has folded, but some (maybe most - not sure) of the employees have transferred to Atari UK where, according to a rep at the Atari Show last week, they are still developing stuff for the ATW. The Helios OS is probably still being looked after by Perihelion software, although they're developing it for a wide variety of platforms.

The base price for an ATW was quoted at the show as being 6000 pounds - somewhat more than originally forecast. For a bit more, you can probably get lots more transputers.

This is *exactly* why I say we won't get good benchmarks until it
ships. We don't have any/enough details about the benchmarks he ran...
and I won't be satisfied until I can run my benchmarks myself.

>(Sorry, the report carries a copyright notice so I cannot post it!) However,
>I think it tends to support the comment regarding a 1/3 speed increase for
>non-recompiled code. Apparently, this performance is projected (by Atari) to
>improve as the TOS on the TT is optimized.

That comment isn't useful until we get an idea of what the benchmark
does. Disk I/O? Screen I/O? Floating point? Compute-intensive integer
operations? Just throwing a number around with no details is not
useful, and inspires a lot of moaning and groaning.

I'm not trying to insult here, but just make the point that the
information isn't complete until we can all sit an ST next to a TT and
run our favorite program.

163. Re: 68030 speed increases (was Re: Atari TT 030 Launched!)

Newsgroup: comp.sys.atari.st
Date: 1990-06-08 00:20:04 UTC
From: jgp@fctunl.rccn.pt
Message-ID: <JGP.90Jun8012004@host.fctunl.rccn.pt>
Source record: 240385

Well, you get the two-fold speed increase going form a 16 bit bus and a 32 bit bus this way:

The 68030 has a built-in instruction cache (don't know about a prefetch queue, but shouldn't need it), which, when the 030 is fetching an instruction not present in the cache, fetches a 32 bit long word from memory and stores it in the cache, too. So, when the 030 fetches the next 16 bit instruction (or operands, or whatever) it goes directly to the cache (or maybe prefetch queue) and gets it much faster than ram (I don't think TT's ram runs at 0 wait states!). For most purposes, and for the vast majority of programs, this represents a 2-fold speed increase. But all this is incorrect because I am not taking into account the fact that the place where programs generaly spend more time, i.e. short inner loops (i think) have a good chance to be executed from the cache after the first pass, and i think that a 256 byte cache is enough for most such loops. And the 030 has got also a 256 byte data cache...

All this coupled to an increase from 8 Mhz to 16 Mhz, and the fact that the 030 takes half as many clock cicles to do a memory access than the 68000 (memory speed permiting), without using the burst transfer mode which transfers 4 32 bit words in 5 clock cicles to the cache (but i doubt that the TT uses that) (I hope I am not confusing this with the 68040!!!), should give better than a fourfold speed increase!

I'd like to state that ever since i read about the TT i have sort of dreamed of owning one, but have always had my doubts of Atari's capabilities to make this a real, usable computer (and supported, almost forgot that one), with real software that can be used to develop applications for more than one platform (I live in a country where the vast majority of PC's [not counting Spectrum's] are IBM compatibles, and I wouldn't try to make a living developping only for the ST). Here, there are almost no third party dealers (almost no official atari dealers, also), harddisks and the like are 2* or 3* the price one can get them abroad, software for the ST is virtually non-existent, and I barely use the ST anymore (1040ST with SM124, no HD, 1Meg), and turn to my brother's IBM PS/2 55 SX, with a 16Mhz 386SX, colo(u)r VGA monitor, 60Mb HD, 2Meg ram, and a decent (portuguese) keyboard. I still prefer the ST, but.... The TT would be my salvation from the PC world, where I developed some applications (and got sick of it, when i needed to write a windowing environment for the next versions of those program, you know, those little windows and menus that every Mac, ST or Amiga programmer takes for granted), but, as i said, my faith in Atari isn't very high... Enough

complainig!

Two (three? 4?) more questions. Why isn't there a 25 Mhz TT ? Apple has got a 40 MHz MacIIfx, and I think Motorola already ships 50Mhz '030's. Will it bee so difficult to upgrade has the other models? And what about a 68040 based TT ? (I think I'm in love with that chip) And why not a proper GEM implementation, with more services managers (for sound, comms, or even extending th

Thanks to everyone who has replied to me about the Spectre CGR emulator!

A simple call to Computability confirmed what many people out there thought: the $295 cost of the Segate 49 meg hard drive was just for the internal drive mechanism. Actual price of the drive with casing, power supply, controller, etc. is a more reasonable (but unfornutate) $969.

This isn't quite right. I never cut anything but whole articles. I commented in the body of material, generally to correct factual errors, in a fashion that was well-marked as being my words.

I think the uproar would be much less if the roaring people had looked at what I actually did. Alternately, anyone could have volunteered to take over the list.

Now, can we put this "issue" to rest already?

I have a program called SDB -- Simple DataBase, or some such --
that implements a relational database, similar to Datatrieve and/or Rdb
on the VAX, DB2 on IBM mainframes, Oracle, Sybase, InterBase, whatever.
Of course, it's somewhat limited compared to these full-scale products
because (a) it was written as a learning experiment and (b) it was
originally written to run on a 60kb (!) machine. But given that
understanding, it does a pretty good job. It has forms, of a sort,
(actually more like scripts that prompt you for input for fields)
and ways to format the output into tabular reports. Again, nothing
fancy -- no pagination or summary lines -- but a start.
It was written by David Betz, author of Xlisp, Xscheme, and AdvSys.
Source files and a document are available as well as a .PRG file.

I also have a public domain spreadsheet called (appropriately enough)
PDSS. I've never used it, but the friend I got it from uses it all
the time.

Let me know if you are interested in either of these,
and we'll work something out. Probably send me a floppy,
and I'll send it back with the stuff on it.

Regards,

I'm quite sure this isn't the case - I have TOS 1.4, and am only one level deep in one partition when it happens. It seems to be that when I see this behavior I am trying to delete a folder called "AUTO" (inside a folder called "FALCON" on my 'F' drive). Perhaps Gemini is linked in somehow to the name "AUTO" (similar to how you can't delete DCSHOWIT.PRG until you reboot without executing it)?

Hehe...To be fair, I think Atari bought the ATW technology and then paid
a third party to deal with the OS and support software. They just
shelled out the (giggle) money. Whether or not the ATW ever sees the
light of day in a mass-produced form is doubtful. 2-3 years ago the
Inmos T800 (the ATW engine) was close to the forefront of RISC technology,
but now it is quickly losing ground to better chips. I have personally
heard from one netter who was using one in England at a university, but
I don't remember any of the details. Maybe someone who has used one will
give us an idea of the capabilities of the machine?

As far as I know the ATW is alive and well. I read in some computing mag that it is to be used to design one of the British entries for the America's Cup. I think our computing lab here at Newcastle has at least one of them.

Who you actual by the ATW from I don't konw. I have never seen one advertised and wonder if the departure of Les Player (former Tech. Manager) from Atari UK had anything to do with it's lack of promotion.

HCJ Writes:
>
>2. Spectre GCR includes a device to read MAC floppies on the ST drives.
>
> This requires roughly 1.44 MB performance from the ST 720K drives.
>
What?
The current generation of Macs use single-sided 400k floppies OR double-sided
800k floppies. (The FDHD drives don't count because Spectre emulates a basic
MAC Plus which hasn't been standardly sold w/FDHD drives)
I realize that the Spectre GCR has to do some *REALLY WIERD* contortions to get
the MFM drives in the ST to read the Mac GCR format diskettes, but
I wouldn't say that this 'requires roughly 1.44 MB performance'.

My Spectre GCR Reads & Writes Mac disks correctly. I still doesn't FORMAT them
correctly but when I download the latest software from GENIE! maybe it will.

Dave Small writes in the manual:
>As of the writing of this manual, we're no certain yet wether or not we've
>gotten all the bugs out of our "Disk Initialize" routine....We're
>certainly trying.

175. TT 030 Expansion

Newsgroup: comp.sys.atari.st
Date: 1990-06-08 14:00:55 UTC
From: pdbeam@watserv1.waterloo.edu
Message-ID: <1990Jun8.140055.25585@watserv1.waterloo.edu>
Source record: 240394

In my discussions with people about my original TT post I've realised that I have a few more facts which people might find interesting.

According to Atari GM Geoffery Earl, the TT 030 is packed very tightly inside its case. The single VME slot is attached to the motherboard by a ribbon cable and folded over so that the VME card is parallel to the motherboard (as opposed to perpendicular as it is in a PC). When I told Mr. Earl that I suspected the single VME slot to be inadequate (what if we want a GENlock card and have the TT hooked into a Enthernet, or something?) he told me that one would have to use a SCSI Ethernet device and not a VME one. I suspect that the kind of expansions that we currently do with STs that involve wiring boards to the motherboard (like PC-Ditto II) will not be possible in the TT.

Also, according to Mr. Earl the TT 030 will be packaged with the 28ms 40Mbyte drive as standard (no option). Mr. Earl also said that there will be a software PC emulator for the TT and that Atai may liscence a hardware PC emulator by a third party (yet another card for that VME slot). Mr. Earl said that Atari will also be liscencing VME boards from companies that sell them at very high prices and selling them themselves at very (comparatively) low prices.

(By the way, that 1/3 speed increase figure also came from Mr. Earl)

> Thanks in advance....
> ---JSN

Finding a newsfeed is the hard part. "Ask around."

The software part is easy. STadel, a version of Citadel BBS software, has supported UUCP mail and Usenet news for a couple of years now.

(You do not see postings on the net from STadel sites because most STadels that receive this discussion have set it to read-only status. Allowing access to Usenet on an open BBS has a potential for abuse.)

The BBS is "room-structured," with very good support for message handling including such features as protocol upload and download of messages, ROT13, and a choice of prompted or streamed reading.

The file structure is integrated into the room structure. All the major protocols are supported, and external programs are easily added.

STadel also networks with other STadels, Citadel-86 (IBM), and compatible Amiga systems. There are a couple of hundred networking Citadels in the United States and Canada.

STadel, like most Citadel software, is free. You can get more information from the Minnesota Atari ST (MAST) BBS, (612) 472-6582. MAST supports all the popular baud rates, 300-9600, V.32 and 18,000bps Telebit PEP.

I think Chris Allen may be running one in England. (Chris?)

If you don't want to change BBS software, you're out of luck unless you want to write your own import-export programs. The Internet RFCs document the Usenet message format and can be obtained by mail. See the newsgroup news.announce.newusers for the periodical posting "How to Obtain Information About Networks."

In addition, you would need a UUCP-compatible transport mechanism. A good one will be released Real Soon Now.

180. Sozobon/Gulam problems

Newsgroup: comp.sys.atari.st
Date: 1990-06-08 17:41:27 UTC
From: dnd15j9z@umiami.miami.edu
Message-ID: <6402.266fab07@umiami.miami.edu>
Source record: 240399

I am having some problems getting anything to compile with sozobon
C running Gulam. I have never used a shell like gulam before, so
i am still unsure how to do alot of things. Here is my setup:

Atari 1040St, 1 Meg and TOS 1.4
Atari Sh204 hard drive, 2 partitions, C:16meg and D:4 meg

The system autoboots with HDBOOT 2.1 from drive D:, and these are
the programs in the \AUTO\ folder:

Poolfix3.Prg
Cache90.Prg
DCshowit.Prg
Foldr100.Prg
Tos14fix.prg

Sozobon is located in C:\LANG\SOZOBON then the \BIN,\LIB, and
\INCLUDE subdirs.

Gulam is located in C:\GULAM

Now, I need to know

1) How should I set up the sozobon environment variables such as
PATH,TMP,INCLUDE
2) Where should I be saving my source code? (What directory, or
does it even matter)?

Most of the time when I do cc filename.c i get error -66 from
gulam, but every so often I will get 4 bombs and error -1.

So, can anyone help? I sure alot of you program under Gulam from
what I have read in the past.

Please EMAIL all responses, because I only get to the newsgroup
like once every 2 weeks.

Or, if you are in the NJ area, call me at 201-276-9667 ANYTIME, or
if you are not in the NJ area, call and I will call you back.

Thanks for any and all help.

-Frank Rachel

Hmmmm, I think that the line #T is the one about the trash can. I've not deleted it on my copy of Gemini, which also runs on Floppy, and so far I've not had any problems, but I'll experiment and see.

The best thing to do is to stick it back in again (you do have a backup don't you?).

There are several commercial programs which allow you to call up services transmitting at 1200/75 bits per second (V23). Two of them are Fastcom (the ST version of Vicom for the PC) and K-Comm. They also support viewdata services (videotex services operating to the Prestel standard). However, they are not PD/Shareware, and are not particularly wonderful programs either.

Uniterm can be made to work with a 1200/75 service by using a PD program called V23EMU. It was written by David Jones in 1986 and is certainly available on several UK bulletin boards. I can mail a copy to anyone who's interested. I had some problems with some characters I typed not being echoed to the screen, but I was never sure whether this was the fault of the program or that of the complicated host I was accessing.

I recently bought a Seagate ST157N in an ICD case,
and am quite happy with it, now.

How can I determine whether I have an ST157N-1 or an ST157N-0 ?

184. Word Perfect - comments anyone?

Yes, does anyone who has Word Perfect for the ST have any strong opinions about it? I just started working with a Mac with WP, and I really like it. Then again, I've been using 1st Word for about 4 years on my ST...:^)

Actually, I've been meaning to get a new word processor for my ST for quite a while, and if the ST version of WP is like the Mac version, I think I'm going to get it. That is, unless anyone reading this has ST WP and can compare it to the Mac.

For example, which features are missing on the ST (if any)? How many fonts are supported? Is it worth it to move to WP or should I stick to 1st Word? Is the dictionary and thesaurus supported? I don't have a hard drive, so can it be run with a 1 MB dual DS floppy system?

Much thanks in advance!

Marty Saletta

(sorry for the many questions, but since this is >$100, I'd kinda like to know if it's worth it before I drop that kind of money for a paperweight...:^)

I am have very frustrating problems with unsharing and untaring files
on my ST. When I unshar, If it gets past the header and then stops! When I
untar, it makes directories named *&^*$@ and I cant delete the suckers!

What am I doing incorrect? Is it the files? I have tried every possible way
of editing the files, cutting every thing but the "--Cut Here--" and then
cutting even the "-- Cut Here --" thing out! Still no go or strange directorie

Help me out and save my sanity!

186. Upgrading to TOS 1.4 yourself

Newsgroup: comp.sys.atari.st
Date: 1990-06-14 03:25:47 UTC
From: jfbruno@rodan.acs.syr.edu
Message-ID: <3724@rodan.acs.syr.edu>
Source record: 240306

I just got finished upgrading my 1040ST to TOS 1.4 with a 6 chip ROM set I got for $80US from Toad Computers (301) 544-6943. The only real pain is that there were no instructions on which ROM chips to put where. I called Toad Computers (they were still there and answering phones as of 6:30 pm!) Apparently, each chip is supposed to have a white sticker stating which ROM socket it goes into (L0, L1, L2, H0, H1, or H2). The problem is, my set only had one chip with a sticker on it, it said "L1". Toad had never heard of this happening, so I had to experiment. This is how the chips go:

```
+---------------------+
|LO2 C300638-002A <
+---------------------+
+---------------------+
|LO1 (C300639-002A??) < (This one had the sticker, no corresponding part #)
+---------------------+
+---------------------+
|LO0 C300640-002A <
+---------------------+
+---------------------+
|HI2 C300635-002A <
+---------------------+
+---------------------+
|HI1 C300636-002A <
+---------------------+
+---------------------+
|HI0 C300637-002A <
+---------------------+
```

Front of the computer here.

No soldering was necessary.

As far as the differences between 1.4 and 1.0, all I've noticed so far is that the "About Gem" dialog box has a color scrolling rainbow fuji symbol (hence the name "Rainbow TOS"), you can hit Ctrl-Alt-Del to warm boot (add right arrow key to cold boot), you can move files instead of copying them by holding the Ctrl key down as you move the icons, the file selector box has drive selector buttons.

I bought the set because the disk access routines are much faster (I've heard) and I'll soon be getting a hard drive. Graphics might be a little faster also, but I haven't really played with it enough yet to notice.

Hope this is of help to someone.

>memory' message.

I don't have any DA's!! And the copile goes just fine (I think, only some warnings about redefinitios-- could be avoided by adding some #ifdef's). As a compiler I use Sozobon C (1.1 I guess). Only programs I have in \AUTO folder are fldr100.prg and clock-program. They take some 15 K RAM together. I surely is a run-time error.... I tried to minimize all vetors and arrays, but did'n get any success. I have to enlarge the stack size and try if it works then....

Not that I'm a fan of LHARC, but

In article <sent.Wed.May.23.16:59:17.GMT.1990.via.CS.TARDIS>
olorin@tardis.computer-science.edinburgh.ac.uk writes:

| There have been one or two postings lately about lharc
| incompatibilities . The main reason for this is the recently posted
| lharc 1.13 . Throw it away ! It wont read anything but ST and MS-DOS
| lharcs ... there are two reasons for this .

The original LHARC that was posted (version 0.73 I believe) was
atrocious! Since then, I've seen the buggy UNLZH v. 1.11 and the now
better v. 1.14 (numbers might be slightly off, since I'm doing all
this from memory -- sory). For the moment, the LHARC.TTP (version
1.13 beta) that Steven Grimm posted w/o any coding other than UUE, is
the best working LHARC that I've found on my ST. In addition, it
seems to be 100 % compatible with our Unix lharc:

C-LHarc for UNIX Version 1.00 (C) 1989-1990 Y.Tagawa, Kai Uwe Rommel

All *.LZH files that've come over the comp.{sources|binaries}.atari.st
newsgroups have been accepted or rejected by both LHARC v.1.13 beta
and C-LHarc v.1.00: lhst113.lzh, minit933.lzh, miniview.lzh,
sambin.lzh, samsrc.lzh, unlzh14.lzh, aua_info.lzh, bbs2903.lzh have
all been accepted.

How come I'm so lucky if others are having such troubles? It took
awhile for me to get a valid LHARC.TTP, but now I have one that works.
I would wish, though, that someone would improve the syntax. If
someone is listing or testing an archive, why do file names *have* to
be specified? ARRGH!

In article <2212@atari.UUCP> towns@atari.UUCP (John Townsend) writes:
>The only _legal_ and Atari authorized versions are available in 2-chip

Did I hear you say that? Is it _illegal_ to have TOS on disk?

Does indeed seem kinda' strange to me, that Atari would like to
stop the spreading of their own TOS. If so, why making a disk
version in the first place??
Or is it just pure greed?

And don't tell me it's because of the incorrect versions of TOS that
would be spread with disks. It couldn't be easier to correct: Send out
an Atari authorized copy of 1.4. Most users would like to have it in
ROMs anyhow, sooner or later.

Can we have a comment on this?

Come on Bob, get a clue!
Just because you haven't heard
of people using it doesn't mean
they aren't out there! are you the
official ATW registry service? Is
this comp.sys.atari.ATW?

Do people who have them want to spend there time
hearing about measly ST belly-aches when they
have a real machine to play with? (ie, what makes
these people likely to (want to) read or post into
comp.sys.atari.st?)

For the record I read in a high end graphics oriented
magazine *last* year that Atari had already installed
more than 400 of the machines. With a specialty machine
like the ATW that is a significant number.

Now back to your regularly scheduled comp.sys.atari.st

Run ICD's RATEHD test which tries to find out the av access time of your
drive. The values it calculates, however, aren't very accurate. You might
try my HD benchmark CHECKHD which is something like a quasi hard disk
standard test here in Germany.

And then someone would patch it, and someone would patch the patches,
and then who would know what we end up with? Yes, I can deal with this
kind of stuff, but Atari has the view that Joe Average ST user just
wants a video toaster and doesn't want to worry about which sub-sub
version of TOS he has on disk. You may not agree, but complaining here
probably won't do any good.

Why don't you try comparing the figure to something that is in the same "computing class"??? Why not see what the Dhrystones are for a Macintosh SE/30 are? Or perhaps a Mac IIcx?

Comparing the figures of a TT to an Amiga 3000 running at 25MHz is not even close to a fair comparison. I would be willing to bet that the TT would compete favorably with an equally equipped A3000.

201. Help needed in tranferring files

Newsgroup: comp.sys.atari.st
Date: 1990-06-14 18:24:13 UTC
From: n8742883@unicorn.WWU.EDU
Message-ID: <1131@unicorn.WWU.EDU>
Source record: 240317

I have been trying to get programs from terminator.cc.umich.edu
and transfer them to my ST. I have no problem with using ftp
from my unix account on my university's mainframe, but am having
a devil of a time transferring the binaries from my unix account
to my ST. I am using ST-Talk Pro, which has all sorts of different
file transfers (except Kermit, unfortunately).

I am attempting to do the transfer by simply listing the binary
code on the screen, and turning on one of ST-Talk Pro's capture
buffers to capture the code. However, there is so much garbage
trasferred due to the binary code being listed on the screen that
ST-Talk Pro freaks out and locks up. There _must_ be an easier
and saner method of transferring files from a mainframe to the ST.

If anyone has any suggestions, I would be more than grateful to
hear them.

Thanx in advance,

Perry Pederson n8742883@unciorn.WWU.EDU

Seems to me that we'd have a situation just like MS-DOS! Which is
only available on disk (it's not ROMable -- that's a DR-DOS niche) and
frankly nobody thinks that's so bad. It even COMES WITH a DEBUG utility
that lets you patch things. Horrors to Betsy!

Maybe Tramiel is paranoid that a ROM version would have clone hardware
built to run pirated versions. He should be so lucky.

I used to have a ST (in fact I had two in my time) and I like to read this newsgroup to keep up with what is going on.

Lately I have got to say ... "Where is the beef?". All the arguments seem to be about how the TT makes the A3000 look silly, how Atari is selling ATVs (funny I aint ever seen one) and whether or not TOS should be on disk.

You guys even want to create a new group that talks about a another machine that probably will never exist in the United States, not that I have a real problem with it, but the signal to noise ratio in comp.sys.atari.st is unbelievable, and I for one, will not carry another Atari group if comp.sys.atari.tt is created. Too much noise, not enough discussion.

Get back to the business of discussing computers and in particular the ST. Bury those flame throwers.

204. High-speed modems: Update

Newsgroup: comp.sys.atari.st
Date: 1990-06-14 20:11:58 UTC
From: Metalist@cup.portal.com
Message-ID: <30782@cup.portal.com>
Source record: 240323

I have gotten so far 3 replies on the topic of High speed modems. Thank you!

I shall be posting complete messages which I received to the NET next Wednesday.

All of the replies were very good, however no one mentioned how FAST the high-speed modems transfer data over
a computer.

All one must do is supply me with the following data: How long does it take a 24oo baud modem to transfer a whole
Atari ST seven-hundred and twenty-K diskette over the modem? Then, I can convert this data for the other modems and determine which speed is for me.

I want to insure that I get a modem which is neither too slow, nor too much for my needs. I have seen BBSes in
my area [San Jose, CA] supporting baud rates close to 2OK! [Ninteen.2K to be exact].

THANK YOU VERY VERY MUCH!

Metalist@cup.portal.com

Not with the Berne convention, to which (belatedly) the US now subscribes.
Most western nations have subscribed to this for years. If some famous
person were to write you a letter, you may OWN it, and even sell it,
but that does not mean that you have the right to publish it.
The author holds the copyright, implicitly.

I think that even if some unsolicited product arrives by mail, and you
don't want it, you may be under some obligation to take reasonable
precautions for it until the rightful owner shows up. Of course you
may charge a reasonable storage fee.

Copyright, by the most recent legislation in the United States (your mileage may vary in other parts of the world), does not have to be explicit. The copyright is implicit in the creation of the work. A person retains the copyright for their work whether or not there is an explicit copyright notice and whether or not the work is published.

It is no one's property except the original author's.

Ummmm, what is this 'Switch Back' thing? If its just a way of getting the ST to think that the internal drive is B and the external one is A (which is what it sounds like) then there is an easy and cheap way... wire a 2 positon switch between pins 19 and 20 in the sound chip so that in one position pin 19 goes to hole 19 and 20 to 20 and in the other pin 19 goes to hole 20 and 20 to 19. The only problem is that any warranty goes bye bye ;-)

212. gulam on TOS1.4

Newsgroup: comp.sys.atari.st
Date: 1990-06-15 12:43:11 UTC
From: wilko@idca.tds.PHILIPS.nl
Message-ID: <667@idcapd.idca.tds.philips.nl>
Source record: 240339

Does anybody know if there is a version of gulam that runs correctly under TOS1.4? This week I got a new Mega 1 with TOS 1.4 and the gulam version I used to run under the old Blitter Tos doesn't seem to like TOS1.4. Gulam starts correctly but the execution of e.g. the mem or ls command results in a crash due to a bus error (?). (I can't remember my Gulam version right now, but it is a beta version)
Any help is appreciated.

There are several flavours of Unix. I was able to compile LHARC on
4.3BSD with fair success, but under System V I can't get it going.
You may simply have the right Unix.

217. Info requested on NCL 5007 SCSI adaptor

Newsgroup: comp.sys.atari.st
Date: 1990-06-15 13:38:25 UTC
From: shc1@ukc.ac.uk
Message-ID: <3051@gos.ukc.ac.uk>
Source record: 240341

Recently I acquired a National Computers LTD 5007 SCSI adaptor
basically it sits between SCSI and ST506

I have been trying to use it with my ICD Atari ST host adaptor
However when the S/W scans for SCSI devices an LED on the board lights up
when the SCSI ID selector matches with that presently being scanned,
but at the end of the scan for all eight devices, the ICD s/w returns with
the message no SCSI devices found !!

I was wondering if anyone has had previous experience with this board, or is
there somthing wrong with the software (fairly new version).

All replies will be greatly appreciated

Sam.

>
>And then someone would patch it, and someone would patch the patches,
>and then who would know what we end up with? Yes, I can deal with this

huh? MSDOS, i believe, never went through all this, and it was a disk
based OS. I can't see why TOS would behave any differently from MSDOS if
it were distributed on floppy. It would at least allow *FAST* distribution
of updated versions of the OS, which is critical if you want people to believe
that Atari is dedicated to providing decent support in order to make the
ST a "real world" machine.

If Atari would regularly release a disk based TOS with proper bug fixes
as Microsoft did with DOS, then there would be no reason for the above
stated scenario. And hell, if TOS was disk based, then all those STUPID
patches like GDOS wouldn't have to be patches anymore - they could be right
there within the OS where it belongs. hmmpphhh!

just adding more fuel to the fire ...

> stop the spreading of their own TOS. If so, why making a disk
> version in the first place??

TOS 1.0 came on disk because ROMS were not ready in 1985.
Beta releases of 1.4 were on disk for developers to test with.
They signed a release to not distribute these disks.

The last bug fixes were never distributed on disk, only burned into ROMS.

There are two ways to go with Operating System distribution.
1. RAM based. PC's, Amigas (I believe, dont FLAME me), and MACs (almost)
work this way. The advantage is fast changes. The disadvantage is
a. fast changes -- macs sometimes seem to have a fix per month --
it implies (to me) not much testing before distribution.
b. it sops up available RAM. you never know from release to release
how much will be available to the user. This is Hell for
developers.
2. ROM based. Atari. The plus is considerable stability. And considerable
more testing. The minus is there is no way to even have a perfect
ROM, as the way people use the box changes even if the code was
correct initially.

So, the result is stay with ATARI, and ROM bases OS or get another box.

>
> GG

This is not a vague answer. Its hard fact. Switch back grabs an interrupt
from the printer and uses it to activate a TSR program that will save
the memory image of the whole configured RAM (.5, 1,2 megs).

The image is loadable on any machine and the program can be restarted.
Most TOS applications work well this way.

It is useful in the following ways:

1. snapshot a game, so that you can restart it at that point.
2. capture a Copy protected program so that it can be run later without
the D..n protect disk. Many CP programs only read the floppy once
and then are happy.

Switch-Back warns that games that boot pose problems.
Also, programs that set out to defeat S-B can do so.

Finally, If a program were to continuously keep checking the CP floppy
then indead there is no real advantage to S-B.

I have it, use it occasionally, and like it.

I think this is true under English law; but under Scots law you have an unconditional right to do what you like with anything that drops through your mailbox.

I once used that, when working in a radical bookshop; we were sent a sample copy of an English-produced booklet aimed at anti-nuclear demonstrators purporting to describe their rights under arrest. It totally ignored the existence of the Scottish legal system and could have got anyone using it here into DEEP shit. I scrawled some rude remarks on it and threw it into our freebies bin, telling the author/publishers that we weren't interested. They replied saying they still didn't believe the Scots legal system was different from the English one and could they have their sample back...

The answer seems to be to use RATEHD to find out the spped of the drive, and then compare with posted rates. The program RATEHD comes from ICD and is released for free distribution for all ST users. According to the documentation there is considerable mis-information about hard disk access speeds. This program reads a number of 1K chunks of data from several regions of the disk, and times each of them. It then does and average to report how many K per second get transferred and the average access time.

RATEHD is available from the file server called terminator.

(the file Binaries/volume5/ratehd.Z)

>based OS.

Well, that's because TOS and MSDOS provide different levels of features. The serial I/O routines under MS-DOS are sadly broken and still are, so nobody ever used the MS-DOS routines and they write their own drivers, especially for high-speed modems (e.g. FOSSIL). On the ST it's possible to run the serial ports at 19.2 kbaud using the serial port, so people go ahead and use TOS -- except a patch was needed to get rts/cts to work.

So the difference between MS-DOS and TOS in that case was that nobody expected MS-DOS to provide that service, so application programmers wrote around it. On the ST, a system program patch was used.

MS-DOS 2.X has the same slow FAT allocation that GEMDOS has, but nobody ever bothered to fix it during the several years that 2.X was out before 3.X was released. Perhaps nobody cared.

Yes, TOS on disk would provide a means for fast distribution of updated versions. But as I keep on saying, repeating yourself repeatedly saying you want something that they don't provide won't get you anywhere, but it sure makes reading this newsgroup hell.

ftp> bye
```

221 Goodbye.

Sometimes you have to type "TYPE L 8" or "BINARY" instead of tenex above. Try tenex first. Now the file can be transferred from your mainframe account to your ST. Kermit is probably your best bet for this. If you don't have Kermit, I recommend you get Uniterm (from terminator). When you get the file to your ST, you will have to un-compress it. There are a few different compression methods used. The most popular of these are ZOO, ARC, and LZH. Most of the un-archivers you need can be found at terminator, in the /atari/archivers directory.

> wonderful programs either.

I can't remember exactly where I heard this, but the above program recieves
at 1200 baud using the normal UART mechanism. However to transmit at the
slower 75 baud rate, the software makes use of ability to set the Transmit
Out pin to the appropriate state (by forcing a Break?). I assume another
timer is setup to interrupt at an appropriate rate for 75 baud, and that
the interrupt routine either sets or resets the TX Out pin for each of the
start, data, and stop bits (one transition per interrupt).

Different compilers give different Dhrystone ratings depending on how agressive their optimization is. Dhrystone does some very strange things, including copying constant strings into word-aligned buffers. Compilers can "cheat" on this by turning strcpy() into a simple loop. As a result, you can get results as high as 1500 on a standard ST.

There are some very interesting and real differences between compilers, but it's hard to use Dhrystone to find which one is the best. Dhrystone is useful to compare the same processor at different clock speeds, but use the same compiler. For example, if you want to compare the speeds of various ST's and Amigas, you could use gcc to compile Dhrystone, and then you would be looking at only the hardware difference, not compilers that may be using optimizations great for Dhrystone but useless for real code.

I suspect you mean CMYB a.k.a. CMYK. This refers to the colour model used in the "four colour" printing process. It stands for Cyan, Magenta, Yellow and Black. Closely related to the CMY model which is the subtractive primary system so called because adding more "stuff," in most cases paint, will subtract with maximum added giving black or no colour. This is in contrast to the additive system of RGB or Red, Green and Blue where the more "stuff," e.g. light from guns onto a phosphor tube, the more colour you have with a maximum of white.

*******
Problem
*******

Here's my situation: I use the Beckemeyer MT C-Shell, which uses the
old MWC ARGV= protocol. I would also like to use software like
Mupfel, which uses the official Atari ARGV= protocol.

MWC:

ARGV=<fd status>\0<av[0]>\0<av[1]>\0...<av[n]>\0\0

Atari:

ARGV=<av[0]>\0<av[1]>\0...<av[n]>\0\0

How can my poor startup code tell the two apart? It gets especially
funky in VSH, where the file handle status string looks berserk! As
you can see, the difference has serious implications.

*******
WARNING
*******

Please do not compile any binaries with Sozobon or DLibs until you
have changed the initargs.c function in the library. It uses an
illegal hack to find the name of the program (av[0]) if xArgs is not
in use, and that hack breaks under Micro RTX. DELETE THAT PART OF THE
FUNCTION. Micro RTX follows the documented TOS rules, and it is
unfortunate that DLibs, which is an otherwise excellent package, does
something so illegal. A library should be NO PLACE FOR HACKS.

I was going to make the same comment... But in fact, it's even worse than that - on my machine with Turbo-16, the figure alternately comes up as 1299.9 or 838.8. (Now, granted, I *might* have done something wrong when I installed my cache-disable switch, but....) I think there's something decidedly wrong with the comp.binaries version.

>For the record I read in a high end graphics oriented
>magazine *last* year that Atari had already installed
>more than 400 of the machines. With a specialty machine
>like the ATW that is a significant number.

Well, for the record, I don't believe *ANY* of the numbers I see "published".

Atari Corp told us all that they had 70,000 Lynxes to sell over the last
Christmas season... that turned out to be a bald-faced, outright lie...
at their stockholders' meeting, the true figure of 30,000 was revealed.

I tend to believe reports from "real people" who actually have machines
like the ATW in their hands. They have a lot less to gain by lying about
things like "installed numbers"...

...and like I said, so far, on all of UseNet, Bitnet, CompuServe, etc, etc,
only three people have mentioned having an ATW. If there were significant
numbers, you'd think we'd have heard about a *few* more...

At any rate, we're not talking about "super-cooled Crays"... it sure seems
to me that for such a fantastic, world-shaking advancement in the art of
computer science as Atari want us to believe the ABAQ, er.. ATW is,
an installed base of 400 machines *worldwide* is pretty poor...

What mainframe are you using..? It might be worth your while to find an XMODEM file transfer program for your mainframe and install it under your own account... I've had to look at doing this for my VAX account, since there's nothing available on the system normally...

Other than that, you might look at getting FLASH for your ST, since there's a KERMIT accessory available for it, if that's all your mainframe offers.

>goes to hole 19 and 20 to 20 and in the other pin 19 goes to hole 20 and 20 to
>19. The only problem is that any warranty goes bye bye

Switchback is a combination hardware and software product. The hardware
is a thing that plugs into the ST's printer port. When you press a
button on it, it saves the currently running program to a file. This
is supposed to allow you to save games in the middle, backup protected
software, and in general allow you to do stuff that you could do with
something like Revolver. (I've never used the product, so the
preceding description is based on other's reports and some educated
guess work.) The problem is that, to my knowledge, Alpha Systems
doesn't have a list of programs with which it is guaranteed to work,
and from my experience with Revolver, things like games tend to do
things that make Revolver and similar products useless, such as poking
wierd memory locations, locking out the keyboard, punting the AES, and
the dreaded "If it ain't on drive A:, I don't see it."

So I basically am trying to compile a list of programs, especially
games, that are known to work with Switchback.

G'day,

I apologise for producing a "little new content" posting. The point I wish to add is that I perceive from the "early" (read this: not too meaningful) statistics is that the 16 MHz TT is quite solidly in the performance ball-park you'd expect for a 16 Mhz Amiga 3000.

That is I think the "quoted" Atari TT speed is respectable.

Quoted Text:
.....
Dave > In article <12659@cbmvax.commodore.com>, daveh@cbmvax.commodore.com (Dave Haynie) writes:

Chris> In article <CMM.0.88.645215952.cmm1@cunixa.cc.columbia.edu> cmm1@CUNIXA.CC.COLUMBIA.EDU (Christopher M Mauritz) writes:

Hugo > l86@nikhef.nl (Hugo Burm) writes:

Hugo > The developers version of the TT (16 MHz) runs
Hugo > at 4100 Dhrystones

Chris> 4100 Dhrystones? ACK! That is awful. You can get that kind of
Chris> performance from a vanilla 386 clone.
.....

Someone has suggested the Dhrystone ratings of the Amiga 3000 at around 6000 -7000 Dhrystones I think (I'm sorry I don't recall which version of D'stone).

I believe that was for a 25 MHz A 3000 no? If so, a simple scaling of clock speed suggests that the 4000 Drhystones for a 16 MHz Atari TT should rate at arond the same value as a 25 MHz Atari TT. {With negligible diff.} No?

.....

PS: if anyone really cares, I own an Amiga 1000. I read this group mostly to check out two things.

1) New hardware/software/Atari_support_details
2) Amiga/Atari "discussions" :-) {my apologies but they are often sources of good info about *both* machines.}

My bottom line is _I_ read this group for good info about these similar PC's.

yours truly,
Lou Cavallo.

>buffers to capture the code.

There are Basic and Unix (C-language) versions of UUENCODE and UUDECODE
floating around. So you can uue on the Unix side, send it via "capture"
mode (text) to your Atari, and then run it thru uud (the Basic version)
to regenerate the binary version.

Clumsy, but it works.

Yes, I've got strong opinions about WP-ST: Buy it at once! It's
light-years ahead of 1st Word in terms of speed, power, ease of use
(once you learn the keyboard equivalents of menu commands), etc., and
well worth every penny.
I presume you're using WP 5.0 on the Mac (it's the only one
that's available, isn't it?). I've never used it, so I can't comment.
Note however that the current ST version is 4.1 (functionally
equivalent, more-or-less, to MS-DOS version 4.2), and as such it
doesn't support multiple fonts. The speller and thesaurus are fully
functional, however. The former is the best in the business, though I
don't use it much. I do use the thesaurus a lot, and keep a copy on
each of my document disks; I keep the speller on a separate disk, and
pop it in on those odd occasions when I want to spellcheck something.
All of this on a 1 meg _single_ floppy system; so yes, it'll run fine
on your dual floppy system.
BTW, for those who already own WP-ST: I had a nice chat with WP
Corp.'s ST support person the other day. Look for a new release later
this year (still numbered 4.1, I think, but with a few new features,
including a postscript driver). The guy I talked to was very positive
about future prospects, and Atari development is continuing at WP
Corp. at the usual slow but steady pace. Sales are reasonably strong,
given the relatively small market, and apparently sales in Europe have
been outstripping North American sales for the past few months, which
bodes well for WP's long-term entrenchment in the Atari marketplace.
All in all it was a very refreshing conversation, especially in light
of Bob_R_Whatshisname's and Chris Something-or-other's continually
boring gloom-and-doom contributions to the net. (If you really want
to kill the ST, guys, I think you'll need a wider audience. Obviously

you haven't managed to get c.s.a.s. readers to see that they possess substandard machines without any decent software and support. Maybe you should try posting to news.announce.important?)

251. High Rez graphics boards for Mega

Newsgroup: comp.sys.atari.st
Date: 1990-06-16 21:21:33 UTC
From: mrose@libserv1.ic.sunysb.edu
Message-ID: <10178@sbcs.sunysb.edu>
Source record: 240170

Hello everyone!

I am the owner of a Mega 2 color system with the Overscan modification.
I am very interested in buying Image Systems color graphics board for the
Mega. It provides 1024 x 768 in 16 colors. Has anyone seen it and can
give a list of it's features? Will it emulate Low, Med, and Hi rez on
it, or do I have to get an additional switch box to be able switch
between the standard Atari Video signal and the Graphics card?

What other Graphics boards are out for the Mega in the US?

I have recently received the May/June catolog from Jade Computer. It
has an add for a Panasonic 'PanaSync' color monitor. Here are the Specs
for it:

Resolution 1024 x 768
Dot Pitch .28
Auto Sync 31 to 37 KHz
Autoscan 50 to 90 Hz
Video Bandwidth 45 MHz
Interlaced Yes
Non-interlaced Yes
Tilt and Swivel Yes
Front Panel
Controls Yes

I was shocked to see them selling this for $488. Has anyone seen this
monitor? Does anyone know if it will work well with the Image Systems
board?

Thanks!!!

Michael Rose

P.s. The phone number for Jade Computer inside California is (800) 262-1710
Continental US and Hawaii (800) 421-5500

The number for Image Systems is (612) 935-1171

I have no affiliation with either of these companies.

252. .PC1 files....

Newsgroup: comp.sys.atari.st

Source record: 240173

I purchased a very old version of WP, and sent away for the upgrade.
On the disks they sent me, one of the files was WP_SPOOL.ACC,
an accessory which (presumably) spools printing.

Well, I have it installed, and I try printing something very huge,
and then I want to exit WP, but it won't let me!! After some experimentation,
it seems to only be a very small print buffer (no more than 4k, by my guess).

My manual (old) says nothing about it, and the little xerox page which
was sent with the new disks (just a printout of readme) also says
nothing about it... Does anyone out there in netland know how to
get more out of this little accessory? If I could configure it for say,
a 64K buffer, it would be quite useful!

Also, I lost (literally, LOST - I can't find it) my new PRINT disk
for WP (august 89).. If someone out there in net.land who also has it
could be so kind as to send it to me, I'd appreciate it
(I do have a legal copy - I can even supply my serial number to anyone who
wants to know, but I thought this would cheaper and faster than contacting
WP directly).

Thanks in advance!!

Hmmm. That's an interesting question. I don't know what contortions you
might have to go through to run a program that does unfriendly things with
video (NEOchrome, for example). I suspect that the Image Systems board will
have the same sorts of problems with uncooperative programs that the
Viking Moniterm might have.

I saw the Image Systems board in action several months ago; it had not trouble
at all with GEM programs that don't make stupid assumptions about the screen
size. I also ran a version of MicroEMACS that was modified by Dale Schumacher
and John Stanley; it very nicely set up an enormous text field. The only
problem I had was with s-l-o-w VT52 scrolling. There's a lot of data to be
moved around.

The Image Systems board will run monochrome mapped to any two colors
you choose as well as the 16 colors out of 4096 palette.

One thing I noticed was that the Image Systems board will let you run
the system with no other monitor. All the Moniterm setups that I've seen
have had a conventional Atari monitor in addition to the Moniterm.

The Minnesota Atari ST user group is planning a demo of the Image Systems
board at next month's meeting. If I can get there I may have more to
say about it then.

256. Color Emulator 1.0 problems

Newsgroup: comp.sys.atari.st
Date: 1990-06-17 02:05:13 UTC
From: PMR2@psuvm.psu.edu
Message-ID: <90167.220513PMR2@psuvm.psu.edu>
Source record: 240179

I haven't been able to find a copy of the program 'coloremu' that functions correctly. When the program runs (from the AUTO folder) it displays an information screen and requests an update speed value (1-6). So far I've only been able to get it to work with 1 and this is unacceptably slow. Other values cause bombs and a reset.

So: are there new versions of this program available (where?) or in the works, or is this due to some hardware problem? I have a 520 upgraded to 1 Mb with the older TOS in ROM (though the program says it works with all versions). I obtained my copy through terminator.

Thanks.

>2. ROM based. Atari. The plus is considerable stability. And considerable
> more testing. The minus is there is no way to even have a perfect
> ROM, as the way people use the box changes even if the code was
> correct initially.
Hey! you forgot one more!

3. EPROM based. Nobody. The plus is that you can have the OS in a
cartridge, permanently plugged into your computer, and it works just like
a ROM-based operating system.
Another plus is that it is easy to distribute newer versions
via dealerships - just give the dealers a rom burner, and newest roms.
The user can bring his/her cartridge into the shop, and the dealer,
for a nominal fee, can burn the newest version into the cart in a manner
of MINUTES.
And guess what? there is no minus!

I WISH a company like Atari would try this...

just daydreaming.....

So send in a question about ATWs for the next stockholders' meeting. What's
nagging about it on usenet gonna prove?
>
>I tend to believe reports from "real people" who actually have machines
>like the ATW in their hands. They have a lot less to gain by lying about
>things like "installed numbers"...

Y'know, I don't see 30,000 posts in rec.games.video from people who own
Lynxes, either. I guess that must mean that they haven't sold that many, eh?
>
>...and like I said, so far, on all of UseNet, Bitnet, CompuServe, etc, etc,
>only three people have mentioned having an ATW. If there were significant
>numbers, you'd think we'd have heard about a *few* more...

Considering the number of Lynxes out there, and the incredibly fast rate at
which they get sold, you'd also expect to see more than 4 or 5 people talk
about 'em on the net. But you don't... I wonder why this is? Maybe, just
maybe, the largest fraction of the world's population doesn't know about
usenet, (egads! someone doesn't know about usenet???) or isn't connected in
any way...

[An anecdote... Lynxes have multiplied like rabbits here at UM. People get
them, show 'em to their friends, and their friends slaver for more. The
College of Engineering's computer support group has been pretty thoroughly
saturated, as has MacTechnics, the local Mac user group. (They're even so
popular in the Mac group that they talked about starting a Lynx SIG within
the regular group. And Mactechnics is probably one of the largest and most
active Mac user groups around, with such die-hard Maclovers it'll make your
head spin...)]

>
>At any rate, we're not talking about "super-cooled Crays"... it sure seems
>to me that for such a fantastic, world-shaking advancement in the art of
>computer science as Atari want us to believe the ABAQ, er.. ATW is,
>an installed base of 400 machines *worldwide* is pretty poor...

No, you're not talking Crays here, true. You're talking transputers, and
parallel processing. Despite the current hoopla over non-Von Neumann style
computer architectures, there really aren't that many people in the world
doing serious work in the area, let alone *talking* about it. It's new and
wonderful, and because it's still so relatively new, it's gonna be a long
time before you see personal-computer style distribution. Too few people in
the world actually understand how to work with a parallel-processing machine,
or how to use one effectively. A Cray is mainly a fast scalar processor.
Millions of people know how to program scalar machines. Vectorizing and
parallelizing is a lot harder, just because the techniques are still being
developed.
>
>BobR

Geeze, Bob, you're beginning to sound just like that Christopher Mauritz dude.
You should know by now that rabble-rousing on usenet doesn't do any good.
If you've got suggestions or constructive criticisms, you should mail 'em
to Atari. If you wanna ridicule or flame, got to alt.flame or something...

This week I got a new Mega 1 with TOS 1.4 and the gulam version I used to run under the old Blitter Tos doesn't seem to like TOS1.4. Gulam starts correctly but the execution of e.g. the mem or ls command results in a crash due to a bus error (?). (I can't remember my Gulam version right now, but it is a beta version)
> > Any help is appreciated.
>
> Oh, panic! I was considering getting a 1.4 upgrade. But it certainly is not worth any money if I will have to go without Gulam!

Don't panic. gulam works just fine under 1.4, except that the "mem" command causes a bus error. It's simple enough to write a little program that uses Malloc(-1L) to check the amount of free memory, and alias "mem" to this "newmem.ttp". I use gulam all the time with tos 1.4 (in fact, it's installed as an auto-boot application, which is a good reason to get tos 1.4 -- so you can see gulam when you turn on the computer instead of that silly desktop :-).

From a vanila 386 clone (Gateway 2000 386/20) you will get
30% more performance, 800% more slots, 100% more RAM, 50% more hard disk space,
100% more flopy drives, 256% more pixels (video) and a multitasking
graphical operating environment (windows 3.0 386).
All for 30% less money.

Actually, it is unfair for the 386 clone to compare it with the TT
since the TT doesn't exist yet. :-)

Message-ID: <1990Jun18.000654.13746@dircon.uucp>
Source record: 240188

You are quite correct, the break level of the MFP is used to get the 75
baud output in Vastcom (sorry, Fastcom) and most other 1200/75 comms packages.
You can also get good results by running at 1200 baud but switching down
to 75 for each character. It works a lot better than you may think because
of the delay in echoing cause by the host. It was the only way to persuade
a Mac to do it!

Message-ID: <30912@cup.portal.com>
Source record: 240192

Heh... Howard Chu makes some comparisons between the Lynx video game market and the Atari Transputer Workstation market... (Hi Howard..!)

Do you know people who have modems attached to their Lynxes so we'd be gettin reports of them here on Usenet..?

(Actually, in a more non-provincial view of the telecommunicating world, ther ARE reports of Lynx owners... a LOT of them... on other telecom networks and services...)

As far as ATW owners, I'd expect the more "professional" userbase on UseNet would be more likely to post their own experiences with an ATW, or mention associates' experiences... so far we have THREE.

Is that a small number for an advanced technology which is just emerging? Perhaps not... but Atari Corp has been talking about the ABAQ/ATW for four years now... that's an awfully small ratio, no matter how you cut it...

Is asking for "real world" reports of ATW use considered "ridicule" or "flaming"..?

Perhaps it's an observation that we're expecting a little too much to expect much support of a new technology like parallel processing from a company which has trouble supplying pre-teenagers with cartridges to play "Gates of Zendocon" on their Lynxes...?

So... anyone else out there using ATWs...?

Christopher Brown asks:
>How does one go about viewing .PC1 files? Could someone also tell me where
>such a utility is available (ftp, net binary, private bbs, etc)...

.PC1 indicates that a picture file was created using DEGAS Elite, in
low resolution *COMPRESSED* mode...

You can use Tom Hudson's SHOWPIC2.PRG which came with DEGAS Elite, or
John Brochu's PICSW7.PRG both of which should be available from any
well-equipped BBS or info service, or most likely on the Terminator for FTP.

>
>Ed <Really, I don't know or I wouldn't have asked> June
I don't think so. It is a graphics processor (blitter, though far better than
the ST blitter) specially develloped for the ATW by Perihelion (the company
who did th ATW for Atari). The chip is known as "Blossom".
It has 4 modes: 960x1280x4 bitplanes + CLUT,
768*1024*8 bitplanes + CLUT,
480*640*8 bitplanes twice (animation) + CLUT
512*512*32 bitplanes (3*8planes for RGB, 8bits free)
It has numerous features for generating lines, areafill, etc.

Btw, anybody interested in Transputers should also read Comp.sys.transputers
obviously!

276. Re: Meaning of CYMB

Newsgroup: comp.sys.atari.st
Date: 1990-06-18 08:56:08 UTC
From: thanatos@pro-graphics.cts.com
Message-ID: <3199@crash.cts.com>
Source record: 240195

In-Reply-To: message from focke@gmdzi.UUCP

CYMB is a printer's abbreviation for "Cyan/Yellow/Magenta/Black", the four colors used to produce "process color" printing.

The mechanics of it are as follows:

When a printer needs to reproduce a color photograph (the most common application for CYMB), he has to separate the photo into four basic, or "process", colors. These are, of course, Cyan (a light blue-green), Yellow, Magenta (a shade of red), and Black. He makes the separation by using various color filters in a darkroom. Once the four colors are separated, printing plates are made of each.

When the plates are made, it goes onto the press. The colors are printed one at a time; Yellow is first, followed by Magenta, Cyan and then Black (it ALWAYS goes in order of lightest to darkest). The inks used on the press are not opaque, they are translucent. When the yellow is printed, you will see all of the areas that are totally yellow and "patterns" of the areas that contain some yellow. Magenta is printed directly on top of the yellow area (using a different plate), giving the picture more detail by adding more color (creating reds and oranges). Then cyan is printed directly on top of THAT (again, using a different plate) giving the greens (cyan and yellow), browns, (orange and cyan) and the rest of the colors. Finally, black is printed over this (using a different plate) to give the picture outlines and shadows. If all four colors are EXACTLY and CORRECTLY aligned, you will see an accurately reproduced copy of the original photograph.

(To get a good idea of this, find a color photo that was printed in a book, such as an encyclopedia or a sales brochure at your local new car showroom. Look at the printed photo under a good, strong magnifying lens. If you look in the lighter areas (with little color), you will see many little dots of yellow, cyan, magenta and black.)

In article <4444@darkstar.ucsc.edu> mostafa@ucscb.UCSC.EDU (Kamal A. Mostafa) writes:
>
>According to my copy of "Atari ST Internals" (Abacus Software),
>here are the codes for the Atari ST VT52 Emulator. I have used
>some of them, and everything worked fine.
Of course, you should realise that Atari did not invent VT52. Just now,
I re-discovered my DEC(tm) booklet that describes VT220 and also VT52.
It is the VT220 Programmer Pocket Guide (EK-VT220-HR-002).

The raw VT52 terminal is very dumb. Atari obviously added some features.
It is a pity that they did not opt for ANSI compatibility (VT100 and up).

>
>ESC A Cursor up (does nothing if at top line)
> B Cursor down
> C Cursor right
> D Cursor left
> E Clear Home
ESC E is not in de DEC booklet, apparently added by Atari.

Atari left out:
ESC F Enter graphics mode
ESC G Exit graphics mode
But I am not convinced that this is part of the earlier VT52 terminals.

> H Cursor Home
> I Cursor up (scroll screen down if at top line)
> J Clear below cursor
DEC calls this Erase to end of screen, which is clearer.

> K Clear to EOL
> L Insert line
> M Delete line (scroll remainder of screen up)
ESC [KLM] are not in the DEC booklet, apparently added by Atari.

> Y Position cursor (do "ESC Y chr$(32+line) chr$(32+col)")

Atari left out:
ESC Z Identify
ESC = Enter alternate keypad mode
ESC > Exit alternate keypad mode
ESC < Enter ANSI mode (This is not really VT52, my guess. It is used
by VT... terminals emulating a VT52 to revert to their normal
mode of operation.)
ESC (space ?) Enter auto print mode
ESC _ Exit auto print mode

ESC W Enter printer controller mode
ESC X Exit printer controller mode
ESC] Print screen
ESC V Print cursor line

>
>ESC b Select char color (do "ESC b 2" to set color #2)
> c Select bkgrnd color "
> d Clear screen to cursor pos
> e Enable cursor

From: gossa@rdge44.enet.dec.com
Message-ID: <205@uninet.vbo.dec.com>
Source record: 240215

I've just become the proud owner of a Third Coast 65meg (ST277N ?) hard disk. My question is should it be putting FM interference ?? I get wide band interference (I can hear the drive's stepper motor) at about 6ft form the machine. A friend downstairs from me can pick up the drives noise output and he's about 30ft and 2 walls away from the machine. (He has a portable radio so the noise is not mains transmitted).

Is my hard drive faulty ???
Is there anything I can do to shield it ???

All answers greatly appreciated (especialy by my neighbours !!)

These are the Degas Elite compressed form of .PI1 files. You can load
them into Degas Elite and I suspect that there may be PD viewers that
handle them as well. Degas Elite converts between .PIx and .PCx files.

282. STE Hardware Scrolling (Help!)

Newsgroup: comp.sys.atari.st
Date: 1990-06-18 13:04:17 UTC
From: aimd@castle.ed.ac.uk
Message-ID: <4781@castle.ed.ac.uk>
Source record: 240212

Hi, I've been mucking around with the horizontal hardware scrolling on my STE but with interesting effects.

I'm working on a mono screen. I originally started scrolling across one picture only but ran into an interesting 'feature' (descibed below) which I just can't get rid off.

I moved on to scrolling across two mono screens, side-by-side.
First I loaded the pictures (64000 bytes) into memory.
I then set LINEWID ($ff820e ??) to 40 since I wanted the video address to move back to the start of the first picture at the end of every line. (and mono screens are 40 words across).
This had the effect of halfing the appearance of a 'normal' screen. But on my two pictures, it displayed the leftmost picture perfectly. So everything is fine so far.

Next I wanted to scroll one pixel so I set LINEWID to 39 (extra width _MINUS ONE DATA FETCH_). This completely screwed the screen, but this is also what should happen.

Now I set HCROLL to 1, but as soon as I do this the whole physical screen (not the screen contents) moves about the equvalent of 6 bytes to the left, leaving the screen contents where they are. The screen base address stays the same but the left border of the mono screen becomes smaller and the right border becomes bigger (I'm trying to explain here that the screen really does *physically* move to the left!).

Not only that, but as I increase the value in HSCROLL, the screen contents scroll but the right border scrolls with them!

The wierdest part, however, is that there is a sort of 'flyback' effect where the stuff that should really be on the right of the screen is bent round to sit on top of the left edge of the screen! As HSCROLL increases, and the size of the right border increases, this flyback effect on the left side also increases at the same rate.

The result is I have a nice smooth scrolling screen with all this wierd stuff going on at the edges of the screen!

What am I doing wrong! Can someone who has tried this please contact me!

Many thanks,
Mark.

Bob

Is this comp.sys.atari.ATW or comp.transputer.ATW ro any such group?
No. This group discusses the Atari ST and related stuff (Atari TT, and the somewhat similar C= Amiga for some reason). You will not get any statistically relevant info by asking such questions as "anybody out there using the ATW?" in comp.sys.atar.st. Some people might have them in their research labs and might also have an ST at home or in the lab and therefore hang out here, but the chance of ATW possessing people having a PC clone or a Mac or an Amiga (of course, Amiga folks would have answered here :-) :-) and reading another group is as great or probably greater than them reading comp.sys.atari.st. That is if they even read the microcomputer groups on USENET. Maybe you should ask in the .transputer newsgroup. And a lot of ATW people probably don't even read USENET. When you have 2 ATWs, each with 9 T800s driving 24/32 bitplanes, you don't waste your time talking about the ST :-). If you are really interested, ask at the next Atari Stockholders meeting. But this nonesense about the ATW and only three reports in comp.sys.atari.st of them being used in the real world (actually I think we saw another one) means nothing.

Now back to your regularly scheduled programming

From: pdbeam@watserv1.waterloo.edu
Message-ID: <1990Jun18.141859.5507@watserv1.waterloo.edu>
Source record: 240203

G'day! (in Canada that's pronounced "G'dee")

I'm almost ashamed to admit after all this talk, but it's very possible that either the Atari Canada GM (who I quoted) made a slip of the tongue when he mentioned the 1/3 speed increase figure or I made a mistake when I wrote it down. The audience pretty well accepted the figure without much discussion and it was only mentioned that one time (ie. never presented in writing). Derek Michoka, our local Atari guru has quoted speed increase figures much larger from tests he made himself.

Please, no flames--I do the best I can.

> Perhaps not... but Atari Corp has been talking about the ABAQ/ATW for four
> years now... that's an awfully small ratio, no matter how you cut it...

Of course, number may be your idea of small simply because of you
have little knowledge of transputers. A collegue of mine who just finished
writing a parallel pascal compiler for a transputer system. It seems that
with current transputers, there is no way to dynamically allocate
communication links between transputers. This causes a major drawback with
the distribution of software in that, if you added a transputer and
changed the configuration of the system, you would have to perform some
kind of re-compilation of your executables. Now, I don't know about you, but
I don't know of too many software developers who would like to distribute
their software. So, of course, the user base will be small.

With the new, 100-150 MIP, transputers they have included a "virtual"
link system which does allow dynamic allocation of transputer links. This
will solve the problem that I mentioned.

Now, to get to the point. The problems you describe may be in no way
affected by the machine it self, but by the transputer. To me, you just
sound like someone who just doesn't like Atari and is attempting to
discredit them in any way possible no matter how childist or inane.
For people like myself who use USENET for information, you are simply an
annoyance who does not ever add any useful input to the system. We would be
most pleased if you stopped cluttering up this newsgroup. Perhaps you could
start posting to alt.penis.length. After all, that's where most of your
postings should go.

Have a nice day.

288. ARGV= replies

Newsgroup: comp.sys.atari.st
Date: 1990-06-18 16:22:00 UTC
From: david.megginson@canremote.uucp
Message-ID: <efe2d8f9768d267d1bc8@canremote.uucp>
Source record: 240221

Thanks to John Bruno and Daniel A. Glasser for private answers to my ARGV= enquiry. Unfortunately, I cannot answer them directly since I am stuck reading this newsgroup on a PCBoard system and not under Unix (they haven't got the new Suns at work hooked up fully to Usenet).

Daniel Glasser wrote:

> This is not what the Atari 'standard' is -- Atari says:
> ARGV=<who-cares>\0<av[0]>\0<av[1]>\0...<av[n]>\0\0
>
> Generally, <who-cares> will be nil.
>
> Daniel A. Glasser
> dag@persoft.com

In that case, the Atari standard and the MWC standard are fully interchangeable if we do not use the terminal status string from the MWC standard ("who cares" under the Atari standard). The German version of Gemini 1.1 uses the Atari ARGV= standard in its Mupfel shell as

ARGV=<av[0]>\0...<av[n]>\0\0

Which hopelessly confuses my startup code, since I get av[0] as av[1], av[1] as av[2], etc. Could I have an official confirmation from Atari?

John Bruno asked how other compilers handle this problem. The last version of the crt0 startup code for gcc which I have seen (1.34 -- not the most recent) doesn't bother with any extended argument protocols, as far as I can see.

>ST...:^)
>
>...
>
> Marty Saletta
>
I consider WP for the ST to be absolutely the premier "power-user's"
word processor, but I don't think it is too similar to the Mac version.
Graphics are not supported, and you don't get on-screen font changes (though
there is a lot of flexibility built in to the printer drivers). Dictionary
and thesaurus are definitely included and work great, but from a floppy-
based system will be somewhat clumsy (unless you can use a ~400K ramdisk
and throw one of the dictionaries up there).

Technically, WP for the ST is version 4.1, although some 4.2 stuff is
included. It is both/either mouse and keyboard driven. The current version
is quite stable, although I still occasionally get a message from the
print menu stating "can't create virtual space", or something to that effect.

Oops! The Atari version is actually
ARGV=\0<av[0]>\0...<av[n]>\0\0.

> How can my poor startup code tell the two apart? It gets especially
> funky in VSH, where the file handle status string looks berserk! As
> you can see, the difference has serious implications.

Actually, they're quite compatible; the best bet is probably to have your startup code ignore the <fd status> string, if it's present, and not worry about it if it's absent; that way it'll be compatible with both MWC and Atari (that's what we did in the gcc startup code).

>
>[warning about the illegal hack in dLibs to find the name of the
> program if xArgs is not used]
>
I agree, people should delete that illegal hack; in fact, they should change to whole initargs.c function to use the Atari/MWC argument passing code instead of xArgs. Now that there's an official standard, we should stick to it. Besides, it's double-plus ungood for children to muck about in their parent's address space. It works for now, but it's going to make problems if we ever get real memory protection and/or swapping into TOS. I've been guilty of this myself (e.g. the fork/vfork functions in the gcc library) so I'm not trying to point fingers; just suggesting that we all should start planning for the future.

I have version 1.03.04.05 and ls works great. mem,however, does not.
And I can use it to run other programs without problems... the emacs
works too...

I am using a 1040 with tos 1.4 and no blitter chip. Perhaps
that is your problem...? or maybe you have an older version...
I don't even know if my version is the current one, for that matter.

> MWC:
> ARGV=<fd status>\0<av[0]>\0<av[1]>\0...<av[n]>\0\0
>
> Atari:
> [Incorrect description deleted to avoid confusion]

You are mistaken. Atari's ARGV= protocol is as follows:

ARGV=<anything>\0<av[0]>\0<av[1]>\0...<av[n]>\0\0

As you can see, where MWC puts "fd status" we allow any data, including
none, and therefore the methods are compatible.

The Atari spec offers a refinement which we believe necessary: the
ARGV= stuff in the environment is only considered valid if the
command-line-length byte (at offset 0x80 in the basepage) holds 0x7f.

Without this refinement, you can't tell if the ARGV= is really meant
for you. For example, a shell (S.PRG) which uses ARGV launches, say,
an editor (E.PRG) which DOESN'T use ARGV. That editor launches another
program (P.PRG) which DOES use ARGV. Now P.PRG sees ARGV= in its
environment, but in fact those are E.PRG's args! P.PRG's args are in
its basepage, but without authentication it doesn't know to look there.

gl8f@astsun.astro.Virginia.EDU (Greg Lindahl) writes:
>There are some very interesting and real differences between
>compilers, but it's hard to use Dhrystone to find which one is the best.

Mostly true. It can be useful as one component in a broad comparison
of many compilers in one environment.

>For example, if you want to compare
>the speeds of various ST's and Amigas, you could use gcc to compile
>Dhrystone, and then you would be looking at only the hardware
>difference, not compilers that may be using optimizations great for
>Dhrystone but useless for real code.

Not quite. Dhrystone benchmarks your CPU, your compiler, AND YOUR LIBRARY.
It is pretty string-intensive, so strchr, strcpy, strcat, etc. get a good
workout. If they're coded in C, you'll probably lose compared to the
same program linked with an assembly-coded string library.

Furthermore, on a machine like the ST where all you get is clock time,
you're including interrupt processing in your results. If you have a
bunch of neat little hacks running at VBLANK, 200Hz, 50Hz, or whatever,
you'll lose. (Try moving the mouse during a dhrystone run -- numbers
go WAY down.) The best numbers will come from a bare ST, with no TSR's
or accessories sitting on interrupts, and don't move the mouse. In
fact, if you run the Dhrystone program from the AUTO folder, you might
get a few extra ticks since AES isn't on 50Hz until after the AUTO
folder's done.

My point is that dhrystone numbers, especially on the ST, are sensitive
to a lot more than the compiler. However, the compiler CAN dominate,
as in the case of Turbo C: it blows other compilers away mainly because
it passes arguments in registers, not on the stack.

MultiSync is a registered trademark of NEC. Like "Band-Aid" or "Coke".

Multiscan is a generic term for a monitor that self-synchs over a variety of
horizontal and vertical frequencies. Like "plastic bandage" or "cola".

Or something to that effect.

>

This is a very noticable difference, and considering Turbo ST has been continuously supported and upgraded for 4 years and Quick ST is an inferior(IMHO) product whose "company" has not demonstrated the kind of support that SofTrek has demonstrated. In fact, Branch Always has already disolved(as per the authors previous post). It makes me wonder about thier level of commitment to the ST community.

For me there is more to a product than just the software itself, there is the user support provided by the company. When Turbo ST first came out four years ago, I was using a very old version of Gulam that would not run with Turbo ST 1.0. I called SofTrek and was told that they had an updated version of Gulam that did work with Turbo ST and to have my modem set to auto answer in 15 minutes. Then SofTrek called me and PAID for the long distance phone call to upload me the new version of Gulam. Now that's user support!

I am not saying that Turbo ST is the best for everyone, in fact in very low memory situations(.5 meg) Quick ST results in acceptable acceleration with lower memory usage. However, for me, it's Turbo ST all the way.

Yes, it seems the STe has been shipped by Atari into the U.S. to some dealers and developers.

I know of one state which is selling STes now, but I cannot release the name because I am bound by a clause I signed when told the information. Or, to put it better, the person who told me did not tell me which state he heard the STes are now being sold in. Perhaps it is just a lie?

297. ****]]] STe NOW AVAIL. IN U.S.!! / 4 SALE IN SAN JOSE, CA ***

Newsgroup: comp.sys.atari.st
Date: 1990-06-19 02:00:17 UTC
From: Metalist@cup.portal.com
Message-ID: <30939@cup.portal.com>
Source record: 240207

Good golly! After posting about what a friend told me "the STe is for sale
in ONE state that I know of," and
that he would not tell me which, I
thougt to myself.. what if it were available in CA? In the Bay Area! Would
that not be trippy...?

So I called SAN JOSE COMPUTER and they have the 1o4oSTe in STOCK! NOW! Well
actually I dont know if they are in stock, they may have sold out already.
Here is how the conversation went,
verbatim from 5 minutes ago:

M=Metalist/ME
SJC=San Jose Computer salesman

M: Hello do you have the STe?
SJC: yes but its the 1O4OSTe
M: How much!
SJC: Six hundred and ninety-nine dollars.
M: So the 1o4oSTe is six hundred and ninety-nine dollars with color?
SJC: No. That is just for the STe. For color it is about nine-hundred and
fifty dollars.
M: Ok thanks!

Somewhat shocking, no? I realize the STe is a souped-up ST, but not that
much right! But take into account
that we have been seeing lots of used STs for sale for $5oo for color systems
and 1 meg and two DS/DD drives [some systems even with a 4omeg HD] and you
conclude that the new ST base systems are much more expensive.

For example SJC sells the plain vanilla 1O4O ST with a color monitor for
Nine hundred and forty-eight dollars. Dont forget tax.

When you hear that, a brand-new STe color system, for "about nine-hundred and
fifty dollars" is very good! Yeah!

So..there ya go! Review: The 1o4oSTE is now available in the Bay Area.
More exactly, for sale at San Jose Computers, San Jose, CA.

Looks like Atari is doing something good again! How long has the STe been
available to the rest of the world?
Or, how long of a delay has it been for the Ste to be available in the U.S.?

Well! I should have an STe by mid-August. It will take a little longer
to save up. I was gonna get a used ST for $5oo, but FORGET THAT! Im going
STe!

A very happy Metalist

298. Re: VT52 codes

Newsgroup: comp.sys.atari.st
Date: 1990-06-19 03:11:49 UTC
From: kgg@zinn.MV.COM
Message-ID: <766@zinn.MV.COM>
Source record: 240208

I have a VT52 reference manual around here somewhere,
but it's lost in the swamp at the moment.
I had to go back to the 1979 (!) |d|i|g|i|t|a|l| Terminals and
Communications Handbook to get the following from the VT100 (!)
table of VT52 compatibility codes.

ESC A cursor up
ESC B cursor down
ESC C cursor right
ESC D cursor left
ESC F select special graphics character set
ESC G select ASCII character set
ESC H cursor home
ESC I reverse linefeed
ESC J erase to end of screen
ESC K erase to end of line
ESC Ylc direct cursor address (see Note 1)
ESC Z identify terminal type (see Note 2)
ESC = enter alternate keypad mode
ESC > exit alternate keypad mode
ESC 1 graphics processor on (see Note 3)
ESC 2 graphics processor off (see Note 3)
ESC < enter ANSI mode (VT100 only)

[1] Line and column numbers for direct cursor addressing
are single character codes whose values are the desired
number plus 37 (octal). Numbering starts at 1. Hence
ESC Y <blank> <blank> would home the cursor.
[2] "The response [of a VT52] to ESC Z is ESC/Z."
I quote the book. I'm not sure what it means.
Looks like a typo to me.
[3] Ignored if no graphics processor installed.

Here are the codes *generated* by keys on the numeric/editing pad:

ESC ? p 0
ESC ? q 1
ESC ? r 2
ESC ? s 3
ESC ? t 4
ESC ? u 5
ESC ? v 6
ESC ? w 7
ESC ? x 8
ESC ? y 9

```
ESC ? m -
ESC ? l ,
ESC ? n .
ESC ? M ENTER

ESC P PF1
ESC Q PF2
ESC R PF3
ESC S PF4

Hope this helps! Good luck!

> of MINUTES.
> And guess what? there is no minus!
>

Well, I am replying to myself, because lots of people sent me private
mail basically saying that I ignored two minus sides to this
distribution scheme.

1] That it costs more...

To this I say : how much more? If a computer implemented it, there would
be a port on the computer specifically for a cartridge which presumably
would come with the computer, and cost of production couldn't be more
than $100, or so, for a total of 256kbytes worth of EPROMs (although
I am not an expert on production costs, so if I am wrong, feel free
to correct me.

2] This one's from Greg Lindahl:

That there will be more versions of the OS to support.

thud.

I mean, really! After the overhead, every user has a very quick
easy and cheap way of upgrading to the current version of the OS, so
theoretically, NOBODY should be using a computer with an old version.
Why would there be MORE versions of the OS to support? I would think
there would only be less! what do you mean?

>theoretically, NOBODY should be using a computer with an old version.

Er, I'm not going to fork out $100 every month for a new version of
the OS. The solution I prefer is for Atari to make up a "master patch
of patches" that you can use with ANY rom version and takes it up to
the latest level. So if a user reports a strange problem, you say
"What version of the master patch are you running?" If it's the curent
one, then you know EXACTLY what they have, despite the ROM. There
would be no excuse for the user to not upgrade (it's free).

I suggested it, but Atari didn't like it. C'est la vie.

>support that SofTrek has demonstrated.....
>For me there is more to a product than just the software itself, there is the
>user support provided by the company....

I just have to say something here in support of Darek and Ignac (hope I spelled those correctly). Quick ST has had tremendous product support over period which it has exsisted, over two years now. It was originally done as shareware to benefit the ST community. In that time, I have seen it go from v1.0 or less to v2.1 now, with at least 5 or 6 revisions between. Up until they went commercial with BRA Software, Quick ST was readily available, for free, on all the major computer services, and most ST bulletin boards. The main reason for going commercial was to make the software more available, and hopefully make a little off the many hours of hard work as they worked to make Quick ST competitive with Turbo ST.

As far as their commitment to the Atari community, I don't think anyone else has done so much for so little for us. Besides Quick ST, they have produced Quick Index, the reference standard fo timing ST's, the full set of Quick Utilities, and the 8-bit Atari Emulator. All very polished products, all shareware. I'm fairly sure they never made much on any of their products, and this was all done in spare time while going to college{

For person to person technical support, Darek has always been available by email on the major services, as well as here on Usenet. He has traveled many hours to attend Atari shows, right after finals even. (Pittsburgh show, case in point.) He also reportedly has some nifty things on the back burner.

I'm sorry for taking up so much bandwidth, but reading that message was like having someone say "Dave Small's GCR is inferior to a Macintosh, and he doesn't provide all the support of Apple." As always, flames to /dev/null.

Not that I want to disrupt these great discussions on the TT, ATW, disk tos, and the A3000, but I just wanted to inject some original material...

If you enjoy the game bounce (the one that you shoot bouncing balls, and other bouncing things) you may want to try starting up with pyro (the screen saver) after the allotted time it will reverse the screen, and the fireworks will start in the background, all while you are playing!

Well, I guess it doesn't take much to excite me does it?

The screen does flicker, some of the explosions remain, and I believe I have seen some of the bouncers be destroyed without me shooting them.?...

Yea, what the hell I will take responsibility! ...ha ha, I had my fingers crossed!

TIPS AND HINTS from other users

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, and STacy.
There are also emulators for the Apple Macintosh and IBM XT available.
Finally, there is the Lynx (a game machine) and the Atari TT and ATW.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

What sort of articles would interest people reading comp.sys.atari.st?
======================================================================

The most interesting articles are technical articles, impressions of
software/hardware, information on Atari user-groups and shows, or helpful
hints on how to make better use of the machine and its software.

The least interesting articles are in the form of 'my computer is better
than...', especially when cross-posted outside of comp.sys.atari.st. If
you don't know how to eliminate other newsgroups from a reply to an article
which is cross-posted, ask your systems administrator.

'FOR-SALE' articles should be posted to misc.forsale, and ONLY local
distribution of comp.sys.atari.st. Those outside the United States have little
desire to read about that neat bit of [hard/soft]ware you're selling when you
live in the U.S.A. If you don't know how to restrict distribution of a posting,
ask your systems administrator.
```

Many articles are in the form of "How do I...?" or "Where do I...?" In this article, I will try to answer some of the most-often asked questions.

Where can I get Public Domain/Shareware software?

There is an FTP source and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

For anonymous FTP: terminator.cc.umich.edu [35.1.33.8]

User anonymous
<enter password>
cd /atari

Most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

For the panarthea mail server, see Steven Grimm's monthly posting. Panarthea holds all of the comp.sources.atari.st/comp.binaries.atari.st postings. If you aren't reading these two newsgroups, you should consider doing so.

How do I deal with Archived files (.ZOO, .ARC, .LZH)?

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are binary files which may contain one or more other files in a compressed format. Archive files usually take up less disk space, and for this reason have become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

These programs are all available via FTP from terminator, in the /atari/archivers directory. Recommended files are:

arc.ttp - needed to extract the other archivers, once.
arc_602.arc - latest version of ARC, with the most fancy features and quite a lot of documentation
lharc.arc
zoo_bin.arc

There are also several GEM programs which act as 'shells' for the archive programs. The most popular are Shareware offerings, also available on terminator in the /atari/archivers directory. They are:

arcgsh21.arc - European in origin
arcsh197.arc - US in origin

The GEM shells are recommended for inexperienced users (and appear to be quite handy for the experienced user as well!) They require a copy of the archive program -- in other words you need BOTH the GEM shell *AND* the archive program in order to use the GEM shell.

Documentation on the use of the archive programs should accompany the archive files mentioned above. To use ARC.TTP in order to extract these files, use the command line:

xh xxxx.ARC *.*

where 'xxxx' is replaced by 'arc_602', 'zoo_bin', etc. For example

xh arc_602.arc *.*

will place all files within the arc_602.arc into the current directory. It assumes you've clicked on the ARC.TTP program from the Desktop and have the parameter dialogue box on your screen.

In many cases, simply typing a '?h' will provide an extensive list of available options.

Source and binary code for archive programs have also been posted to comp.sources.atari.st and comp.binaries.atari.st. They are available via e-mail through the panarthea archive server. See Steven Grimm's posting for more information on how to obtain files from panarthea.

What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

Below is a letter, originally written by Darryl May,
that John Townsend of Atari posted on GEnie in January to provide some answers. This letter also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170).

Dear ATARI customer,

The following is an official list of the errors that can appear while you are operating your ST computer. This first list gives you the GEM error messages:

Where can I get copies of ZNET?
==========

ZNET on-line magazine is available on CompuServe and GEnie. You can also get
copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg
Lindahl provides an excellent service to the networking community by sending
these out.

ZNET and some information from the Current Notes user magazine are also
available from the terminator archives under /atari/magazines.

ST Pen Pals list
==========

Simon Chappell is compiling a list of people interested in exchanging
paper-based mail "of interested parties who could then
keep in touch and prevent themselves losing touch with the ST community
at large (this would be especially easy if someone who still had net
access could summarise current topics or forward news and advice!)"

He is accepting entries in this format:

eg Simon Chappell.
s61304@uk.ac.psw.pa (goes away after June)
51 Amherst Road, Penny-Come-Quick, Plymouth, Devon, PL3 4HJ. UK.
C, operating systems (UNIX, VMS) & relational databases.

Contact Simon at his e-mail or paper mail address if you are interested.

TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

==========

I would like to thank those who sent messages with suggestions and comments about my initial posting. I would appreciate feedback, comments, suggestions for more TIPS AND HINTS, etc. E-mail can reach me at the following:

Well, when a friend of mine patched my TOS and we put it on EPROM,
the cost was only about US$45 for the 27256 150ns EPROMs. If you
double that to account for the cost of the dealer's time, you
still come out under the official $100 upgrade price of Atari.
Actually, I think masked ROMS are even cheaper than EPROMS so they
are making quite a bit of cash for this upgrade. Makes you wonder
where their priorities lie, eh?

Thud #2. This argument is simply foolish. Multiple versions of the
OS doesn't seem to be hampering MS-DOS of MacinTosh development,
does it? If anything, this forces the computer company to be a
lot more backwardly-compatible in future OS releases, no?

307. How to tell if Drive B is attached **SUMMARY**

Newsgroup: comp.sys.atari.st
Date: 1990-06-19 15:52:16 UTC
From: jeff@quark.WV.TEK.COM
Message-ID: <7475@orca.wv.tek.com>
Source record: 240227

```
Overall, I received several of the same answers, that being _nflops. However,
one response stands out, from Patti Ryan. It looks at the drive map, and then
if drive B is not present it maps it out.

Thanks again for your help!

-Jeff

SPEEA - Just say no.

------------------------------------------------------------------------------
The "Winning" solution. (It was also the first :-)
------------------------------------------------------------------------------

>From "RYAN,PATRICIA ANN" <mailrus!gatech!prism.gatech.edu!gt3764a@uunet.uu.net>

Jeff -
Here is a little C function I wrote which returns the true
drive map. It uses the protected system variable _nflops at
$0x4A6 which indicates the actual number of floppies connected.
Hope this solves your problems.
- Patti -

#include <osbind.h>

long drive_map() /* This function returns a bit-wise encoded list */
/* of the available disk drives. It does not */
/* indicate drive B arbitrarily as does Drvmap(). */
{
register long user_stack = Super( 0L );
register unsigned int _nflops = *( unsigned int * )0x4A6;
register long map = Drvmap();
Super( user_stack );
if ( _nflops > 0 ) {
_nflops *= 2;
_nflops += 65531;
map &= ( long ) _nflops;
}
return( map );
}

------------------------------------------------------------------------------
The following 6 folks gave information regarding _nflops.
```

>From "R. J. Balkwill" <balkwill@ncs.dnd.ca>
>From bluneski@pogo.WV.TEK.COM (Bob Luneski)
>From hcj@lzsc.att.COM (Howard C. Johnson ATT Bell Labs)
>From csbrod@medusa.informatik.uni-erlangen.de (Claus Brod)
>From LarsErikOsterud <larserio@ifi.uio.no>
>From uab1018@dircon.uucp (Frank J Leonhardt)

There is an official system variable called _nflops in the $4xx area which
you can use for that purpose. It contains 1 if you only have drive A and
2 for both drives. The address is $4A6.

And, for the most obscure answer:

>From: woju@image.UUCP (Wolfgang Jung)

Hi
===
You could select your Drive(A,B) Via the Soundchip which controls the Drive-
select Siganls off the Floppy Bus, turn via FD1772 the Motor on and request all
Indexpulses an IRQ, if you won't get on Indexpulse in 1 s (there should be
300 /s) you probably haven't connected a Drive.(thsi can only be used with
3.5" Drives, because those have an Hardwires Indexpuls(the turning Motor
creates it) If you Use 5 1/4 " Drives you have to search an other Way to get
to your Information(I don't know if my way will work....)

End of summaries.

Thanks again for your help!

> thing I asked him about was making db (their binary-level debugger) work with
> TOS 1.4. He recommended against trying, for example using the binary patches

Indeed, db has problems with tos 1.4 . However, I get by with the simple patch that allows db to think tos1.4 is a mega version. However, I usually need to reboot after debugging a large program.

MWC 3, has another bad bug. The rev 3 assembler, will not accept name:s constructions. Happily, the rev 2 assembler does, and its output is accepted by the linker. There are other nasties in the assembler, which MWC has ignored all along.

Hopefully, if Atari pays them to do the TT, they'll fix the rest.

All in all, it still the best that is out there, especially if you want a UNIX(r) look and feel.

There are two other good methods for Kermit on your ST - Uniterm has an excellent Kermit implementation, and the "official" ckermit, which contains a full terminal implementation, is available for the ST. Both should be available in the usual places, and neither is a commercial program. If you are unable to locate either of them let me know and I'll try to help.

Wrong-O. With the Mac, all the software company has to do is say "Our product needs the latest version of the OS that you can get for your machine." Since users can upgrade for free, there is no need to support obselete versions (although old hardware has more limitations).

The scheme I proposed for Atari is similar to the Mac scheme, and cheaper than EEPROMS. Now can you quit flaming my email and listen to my postings? As I have repeatedly said, just because I can see all sides of an argument does not mean I am a fanatic supporting one side or another.

>the OS.

er, why did I give you the impression that such an operation would cost
anything near that price? The EPROMS themselves cost $100 to manufacture
(or at least, that is my guess)... To copy new data onto them (which
is the whole point of getting EPROMs - that you can do this sort of thing),
would be basically free (like copying a disk) but the dealers should charge
a nominal fee just for the cost of keeping up-to-date on the newest
versions...

> The solution I prefer is for Atari to make up a "master patch
>of patches" that you can use with ANY rom version and takes it up to
>the latest level. So if a user reports a strange problem, you say
>"What version of the master patch are you running?" If it's the curent
>one, then you know EXACTLY what they have, despite the ROM. There
>would be no excuse for the user to not upgrade (it's free).
>
>I suggested it, but Atari didn't like it. C'est la vie.

Another good idea - but at that point, we might as well have the
whole OS on disk....

313. Info on TT

Newsgroup: comp.sys.atari.st
Date: 1990-06-19 18:37:43 UTC
From: fred@ruuinf.cs.ruu.nl
Message-ID: <3487@ruuinf.cs.ruu.nl>
Source record: 240233

On the official bulletin board of Atari the Netherlands, this message was
posted by Atari. I have translated the message from dutch to english.

Message : 16517 [Open] 6-17-90 11:00pm
From : Sysop Wilfred
To : Fred Appelman (x)
Subject : #16466 TT op 32 MHZ?
Sig(s) : 9 (Portfolio)
There are 3 replies

These are the specifications of the TT as they are released to the
press last week.

TT

68030, 32 Mhz
Optional: 68882 (De 68881 is not fast enough)
2 Mb ST RAM, extendible with 2 or 8 Mb
Optional: 4 or 16 Mb TT (FAST) RAM
512 Kb ROM
720 Kb floppy
48 Mb SCSI 28 ms harddisk. Optioneal: 80 Mb en 100+

Interfacing: 2, extendible till 4 seriel ports
1 parallel port
1 cartridge port ST
1 DMA port ST
1 MIDI IN, 1 MIDI OUT
1 ST compatible keyboard connector
1 SCSI port 25 pins
1 low speed LAN port
1 VGA compatible monitor port

Video modes: 3 ST modes (Low, Medium, High) with palette of 4096 colors
320x480 with 256 colors from 4096
640x480 with 16 colors from 4096
1280x960 monochrome

Delivering: The first 6 machines are delivered to major software
developers in the Netherlands and Belgium. Already 12
machines are delivered to Germany. The first real production
is expected in August. Mass production is expected in September.

Price Dfl 6500,- ($ 3.200) excl. tax, incl. MULTI-SYNC VGA color monitor.

Remarks:

ST software without adjustment 5-7 faster, after optimalisation at least 10x.
FAST RAM is only used by the processor and by the SCSI port.
SCSI tranfer via TT RAM gives 20% more HD speed than via ST RAM. Software in
FAST RAM is faster too.
In fast (TT) RAM we use burst-fill to fill the cache quickly, in ST
RAM we do something smart with the 64 bit arrays used for the the video logic.
ST RAM is 32 bits but is accessed with 64 bits by the video logic.
If there is no TT RAM, the SCSI controller also works with ST RAM.
Software is loaded in TT RAM by using a utility like MAKEFAST in TOS
1.4. Two bits are set in the file header to indicate the program is to
be loaded in TT RAM.
Compatibility tests have given must better results than expected, although
some programs had to be changed. It was remarkeble how many programs run
without any change. Some of the programs DID use the new features of
the TT right away. If a program didn't run, lots of times it was enough
to switch to ST video mode to solve the problem.
TT TOS is called TOS 3.0 and is functional equal to TOS 1.6 with some
extensions for the new hardware of the TT.

The rest you have to read in the magazines (The dutch magazines) which
will be in the shop soon.

>>Er, I'm not going to fork out $100 every month for a new version of
>>the OS.
>
>er, why did I give you the impression that such an operation would cost
>anything near that price?

Dealer margins. When something costs $30 to produce, a dealer will not
sell it to you for $30. And if the dealer has to install it, that
costs money too. And if software packages required you to buy such an
upgrade every 6 months, you'd be a lot poorer.

[discussion my suggestion that Atari should put out a
constantly-updated super-patch program that would bring any ROM
revision up to the latest]
>
>Another good idea - but at that point, we might as well have the
>whole OS on disk....

No, putting the whole thing on disk takes more RAM and results in slow
booting. With ROMs and the "super-patch" you get the best of all
worlds: minimal ram usage, low cost, easy upgrades.

MICHAEL,
We use Spectre together with a memory upgrade from 1 to 2.5 M from
Frontier Software, North Yorkshire, England. PO Box 113, Harrogate.
Price in Holland about $ 450 (100 card, 350 chips). No problems ntil
now. Works fine with Spectre 128 and PC Speed (Dos-emulator).

317. High-Speed Modems for the Atari ST: Summaries

Newsgroup: comp.sys.atari.st
Date: 1990-06-19 21:57:40 UTC
From: Metalist@cup.portal.com
Message-ID: <30956@cup.portal.com>
Source record: 240237

Thank you all for your submissions to my mailbox! They were very informative and [in a few cases] nicely blunt!

It seems the U.S. Robotics ninety-six hundred HST is the best modem available for the ST. Most ST bbses supporting higher baud rates use the HST by U.S. Robotics. I have seen the price range from as low as $4oo to as high as seven-hundred, depending on where you shop.

And now, the summaries. Thanks once more.

Metalist

From: ckb@ATHENA.MIT.EDU

Most 19.2K bps modems do support all the lower speeds. The better ones, when hooked to a modem of the same type actually sample the line for the fastest possible error-free transfer.

As far as speed comparisions, the transfer protocol you use has a large effect as does the line quality. But the difference in time should approach the difference in baud (e.g. 9600 is 4x as fast as 2400).

Us Robotics sells a good 9600 bps modem for the ST. You used to be able to get it cheap if you were a sysop. I dont know about 19.2 K or higher for the ST, although, like you, I know its available. Unless its self-correcting as mentioned above, I believe line noise would be a problem frequenly.

From: David Forster

A recent (June, even?) issue of Computer Shopper had a section on buying modems, which I found fairly informative. The upshot of it is: 2400 baud modems are generally interchangeable, but check them out when you get them, because tolerances are sometimes very tight (an office mate had to return his brand-new modem because it wouldn't work with our local phone system and the modems our machines use, but another user here has had his running for a while, and finds it more reliable than his old 1200 baud modem was).
Once you get up to 4.8k, you get into the realm of shifting (or non-existent) standards. A number of cheap 4.8k modems are cheap because they won't work with a wide range of equipment on the other end. (In our case, they wouldn't work at all, since we don't have any 4.8k modems!) I don't know when standards will finally be established, but I expect it won't be too long.

Anyway, don't take my word for it (this is all from memory, anyway), go out and get a copy of the magazine, if you can.

From: LarsErikOsterud <larserio@ifi.uio.no>

In Norway we don't use the HST standard but CCITT V.32 (9600 MNP5)
Most BBS'es offer this standard now (including my own) and some even
offers both V.32 (9600) and HST (14.4K) speeds.....

From: sun!usc.edu!baffoni%alcor.usc.edu (Juxtaposer)

Actually, I have used my 2400bps modem to transfer stuff at an average
of 230 bytes/sec. I think this works out to be under a meg/hour:720k/230=52
minutes. However this is with little or no line noise and this is using
y-modem with 1k packets. I could get a slightly higher throughput if I used
something like zmodem which, if it has the proper emulation, will transfer a
continuous stream and only send acknowledgements and bad blocks at the end.
Also you must consider the increasing amount of noise that gets into transmis-
sion as you creep up the speed scale so, even though I get 230 cps with a
2400bps modem, it does not neccessarily mean you will get 920cps with a
9600 bps modem.

Hope this helped.

From: jvl@idca.tds.PHILIPS.nl (J. van Loenen)

Hi Bryan,

I read your question about modem speeds. It is not exactly what you asked
for but maybe it helps you:

The biggest files I send were about 200k. I send these files several times
and the time to transfer them was nearly constant. I used ZMODEM on good
lines, so 1024 bytes blocks were used.
I use a 1200 baud modem.
I get a throughput of 103 - 104 characters per second.

This means that 10k will cost 99.5 seconds.

So 2400 baud 10k should be 49.7,
720k should be 3579 seconds = 59 minutes and 40 seconds.

using XMODEM I get a throughput of nearly 90 characters per second.

Hope this will help you,

Bye,
Jan

> convert this data for the other modems and determine which speed is for me.

Well, why don't you figure out that by yourself?

It's quite easy: 2400 baud actually means 2400 bit/sec.
An 8 bit-byte is transferred as 10 bits, since there
is are additional start- and stopbits.
In theory, you get the following:
2400 baud = 240 byte/sec = 14.400 byte/min
If you want to transfer 740.000 bytes it'll take you
740.000 byte / 14.400 byte/min = 50 min

But that's theory. In practice, you need a protocol (kermit, xmodem, ...)
to insure that your data is transmitted correctly.
These protocols do a handshake after each tranmitted block and thus
decrease your transmittion rate enormously.
Depending on the protocol, you get only 50 to 70% of the
original transmittion rate.
And this decreases further if you are on a bad phone line.
Such a bad line causes transmittion errors which, in return, cause
a retransmittion of the erroneus blocks.

Furthermore you have to take into account that higher transmittion
rates require better line quality, i.e. you will get more transmittion
errors using higher baud rates, thus increasing the need for retransmittions.

Concerning the 720K of a disk: you can try to compress them for
transmittion. The compression ratio depends on the type of compression
and the tye of data. Highest compression ratios you get on ASCII-Texts.
Some tools (UNIX-compress or LHARC) can compress ASCII-Texts down
to than 30% of the original size.
Compression on progam binaries is not so good, a good compression can acheive
60 to 80% of the original size.

Some modems support a compression themselves (MNP5 e.g.).
This compression is not very effective and is - in general - only
effective on ASCII-Texts.

> I want to insure that I get a modem which is neither too slow, nor too much
> for my needs. I have seen BBSes in
> my area [San Jose, CA] supporting baud rates close to 2OK! [Ninteen.2K to
> be exact].

By the way, the PEP mode (which is the one that is always used if
you want to communicate at 19k2 d o e s a l r e a d y include
a special transmittion protocol, which decreases the actual transmittion
rate down to about 15k, depending on the phone line)

>
> THANK YOU VERY VERY MUCH!
>
> Metalist@cup.portal.com
>
>

Hope this is what you wanted to know.

From: ckb@ATHENA.MIT.EDU

Thinking back to my old PCP days....

Large arcs could take 40-50 minutes, depending on how many retranmissions were made, at 2400 bps. Large arcs were in the area of 600K, so an hour per 720K isn't probably too far off.

My only concern is whether or not I was at 2400 then. Those may be figures for 1200. Hmm....

The above was using YMODEM or XMODEM 1K protocols. Zmodem or SEAlink would be faster is the line quality was good.

Ill see if I can find out more....

Chris

I am asking this mainly of the rest of the world, but if any of you fellow Americans feel you can contribute, please feel free to do so.

With the STe now available in America, there has been a great renewal of faith in Atari here. However, this was dampened recently when a friend of mine mentioned that the STe is incompatible with the original ST!

My friend saw a magazine article listing TWO PAGES of games which work on the ST but WILL NOT RUN on the STe!
Can this be true? I need answers, and I need them NOW! I am asking the WORLD to help me. Before I buy an STe, I need your undivided attention and support.

Please, inform me: Is the STe incompatible with the ST? Or is this just a bunch of baloney? Those of you in Europe, Canada and elsewhere have had access to the STe for some time now. What problems does it possess? I thought it was just an ST, though enhanced with a few extra goodies like better color and sound and a few extra ports.

Please send me mail at the following address. Your replies mean everything to me. I will post summaries of your replies to the NET and local BBSes in one week so that we can spread the news about.

Fortuntely there is Smalltalk-80 for ST. I don't know what exact config
requires, you could probably squeeze it. recommend more memories.
Contact Parc Place for furthur information. For usability of running
smalltalk-80 on ST, I remember old days when I used to run St80 on
Tek4044 which had similar configuration(Amazingly, it ran st80 faster
then PP St-80 2.5 running on Mac-II, I guess for every two steps forward,
you have to go one step backward...). Good luck

hmmm. you seem to keep missing my point... This is frustrating.
We are discussing an imaginary concept here, one I made up myself,
(but if someone else thought of it first, I wouldn't be surprized,
since it is such a nifty idea) and described fully in my messages
on the system, but you criticize my ideas without reading what
I am typing.

This concept, I will call EPROM-based OS systems, where the
manufacturer of the COMPUTER builds it with a cartridge port
and includes with it a cartridge of EPROMS which have the current
version of the OS on them, made specifically to be plugged into
this port. This is the only thing which needs producing. You'll
never need to buy a seperate EPROM set from the dealer unless
the one which was included with your computer BREAKS.

When new versions of the OS come out, the user brings
his/her cartridge to the store, has the new version copied
(or burned, if you like that kind of terminology)
onto the EPROM cartridge which he/she got with the computer,
brings it back home and plugs it into his/her computer again.

got it now?

325. Gadgets 68030 info = Wrong

Newsgroup: comp.sys.atari.st
Date: 1990-06-20 03:42:45 UTC
From: dsmall@well.sf.ca.us
Message-ID: <18625@well.sf.ca.us>
Source record: 240134

Howdy. At NAMM this week I saw a copy of a message that (apparently) went through the net while my UNIX machine was offline, and while I hadn't logged into the Well. It mentioned all sorts of details about the Gadgets 68030 board -- how it had an 8350 SCSI controller onboard, and so forth.

Someone brought it to me to ask if it was true.

No, it's not. Nearly everything in the note, except for the "68030", was flat wrong. It's sure irritating to have people do stuff like this. For all I know, someone saw the MegaTalk writeup, assumed it was the 68030 board (hunh?) and SCSI I don't know *where* came from ...

While I've got a working 68030 in the Mega-4 downstairs, it's a major-league prototype, with the things you assume in a proto -- plug in adaptor cards, wire-wrap wire running everywhere, and so forth. Spectre is not yet completely up on the 68030; peripherals still need to be taught about the higher speed and about caching. (As of today, for instance, the Spectre can boot and run fine (real quick, too) on the 030, but floppies are still down, and sound is horrid...) In other words, it's midway through development, and just not done. To put this in perspective, I imagine about a case of Diet Pepsi will be enough for Doug to wrap up the 030 part of Spectre
and put it to bed.

The 030 has been tested quite a bit, because we have to find out where the performance bottlenecks are. Both on GEnie and on USENET, there have been discussions of just this re: the Amiga at 16/25 Mhz. What it boils down to, if I understand right, is that inexpensive SIMM D-RAM at this point in time isn't capable of sustaining the 68030 without heavy duty waitstates above, roughly, 18-20 Mhz.

Currently the board is clocked at 16 Mhz. (Note word "currently".)

One problem with posting info to the net is that it tends to be taken as How The Product Will Be Forever, spread to 18 million user group newsletters, and so forth -- not as Today's Prototype To Fix A Bug, like it was meant. But the info in that last spec sheet was so far wrong that I felt I should let you know before anyone took it as gospel.

I'd love to find out who made it up.

We've been doing all the typical, dull, un news-worthy revisions and revisions and revisions of boards, they all take awhile, sometimes there's film setup problems, the board shop messes up, and so forth and so on. It isn't as exciting as rumours, but it's the truth. I hope to get the next cut of 030 boards (there's like 10 in a run for sample-testing) this week.

Then we can find out if we've addressed the speed issues right and fixed some other minor snags, none of which are worthy of comment.

Anywho, that's how it's going, nice and steady.

I suppose it could happen that we'll find out that the parts just cost too much, or it's too much drain on the power supply, or it throws X-rays at you and kills the user, and have to drop the project. But my feeling is that we wouldn't be spending so much time and money on this if it wasn't going to pan out ultimately.

You can ask questions about it, but look, I may not be able to answer them, because a) the answer could be wrong next week, b) I might want to save a surprise or two for the rollout, c) it might be an option we haven't considered yet, or d) it might be something we don't know -- say, a performance question on a configuration we have not tested.

Take 'er easy.

If I only had a system() function call available. <sigh> But anyways how do I clear the screen when using Marc Johnson C?

Please send any/all responses to msb@ecl.psu.edu [InterNet] or MSB@PSUECLB [BITNET] since this account dies today.

Thanx,

Mike Barthelemy

>
The gcc has always supported the Atari extended argument protocol
(the original libaray support the MWC without the console string, which
is what became the Atari standard). The decoding was originally done
in crt0.s, got moved for a while into a separate module (crtinit.c??)
and is now back in crt0.c.

>hmmm. you seem to keep missing my point... This is frustrating.

Next time maybe you can finish our discussion in email before you post.

> This concept, I will call EPROM-based OS systems, where the
>manufacturer of the COMPUTER builds it with a cartridge port
>and includes with it a cartridge of EPROMS which have the current
>version of the OS on them, made specifically to be plugged into
>this port.

So you pay extra for the port, extra for the EPROMS verses ROMS, and
dealers have to pay extra for an EPROM burner and keep track of which
EPROM goes in which type of ST, because there are 2 different sizes.
The machine would probably be a bit less reliable, as that connection
would not be sodered, it would just be a contact. You'd pay perhaps
$50-$100 more for the computer -- bad news for a machine that sells
for $650 -- and you have no advantages over the my mythical
"super-patch" program, which would use the same patch file for any
kind of ST.

>got it now?

Yeah.

From article <30915@cup.portal.com>, by Bob_BobR_Retelle@cup.portal.com:

> The STe has been reported as having been sighted at local Atari dealers
> in the U.S.A... Atari seems to be quietly shipping the new model of
> the ST to distributors and dealers...

Living in New York state, and CANADA being so close by :)
I've had my 1040STe for what seems to be forever...

Other than being able to upgrade the memory easily (VERY EASILY!!), and the blitter (which I have now gotten used to, so I don't notice it anymore), I haven't seen any advantage the STe has over the ST EXCEPT that I can listen to my keyclicks in Stereo (which looses it's novelty REally quick)...

As to compatibility (which some are asking about) with the ST, it seems that about 4% of the comercial games a friend of mine and I have tried didn't work. He purchased well over a hundred games, and tried them all on his new STe. Games have always had the most compatibility probs. The only non-game programs that I couldn't get to work on the STe were STTalker (neat voice synth.) and the TWISTER disk formatter... Oh and the "no screen boundaries" demos have problems...

I have head about the demos Atari shows the STe with (like the white water game?). But STILL haven't head from the STe's STEREO digital sound chip. I STILL haven't seen any pictures that make use of the 4096 color pallet. I STILL haven't seen any programs that make use of the hardware fine scrolling (A new BIGSCRN.PRG would be nice :) The two new 15 pin ports haven't helped me any. I haven't head of any way to make use of my newly GENLOCK ready capibilities... Is there anything else that I missed that I'm missing?

GETTING THE PICTURE?

It's like owning one of the first lightbulbs ever made, and then having to wait for your town to be wired with electricity! (VERY frustrating)

If I understand the "EEPROM" cartridge idea for storing the Operating System in a computer, the OS would be contained in EEPROMS in an easily removable cartridge...

When Atari (or whoever makes the computer in question) announces a new version of their Operating System for whatever reason (bug fixes, faster operation, etc...), you'd simply pop the OS cartridge out, take it to your local dealer who has already received the new "master" of the OS, and he'll reprogram your OS cartridge by plugging it into a "black box" EEROM programmer...

There would be NO cost to the user, Atari would be sure that only THEIR "official" versions of the OS would be in use (since only the "black box" would write to the Atari cartridge), and the user would have the very latest version of TOS, for only the cost of a drive to the local dealer...

Just two comments...

I like it... and it'll never happen...

>remember that the majority of ATW's have been sold to corporate research
>departments and UK institutions, neither of which you are likely to hear
>much from.

Actually, no... since Atari Corp had hyped their ABAQ/ATW for so long,
I'd simply been watching here in the Atari newsgroups for any reports of
"real people" using them... I'll check the other newsgroups though..
(thanks for the suggestion...!)

I understand that many organizations that might be using ATWs might not
have any direct connection through UseNet to the Atari newsgroups, but
still, I'd expect that we'd hear about SOME of the installations and\
applications...

Do this... hold up the fingers of ONE hand... now put down two fingers..
what you're left with is the number of ATW installations we've heard about,
in the entire WORLD...

>this nonesense about the ATW and only three reports in comp.sys.atari.st
>of them being used in the real world (actually I think we saw another
>one) means nothing.

Actually, I didn't pose the original question... someone asked something like "What ever happened to the Atari ATW??", and I answered by asking if anyone here on UseNet had any information about any "real world" installations of the ATW...

I think it's of interest to anyone who cares what's happening in the\ "Atari World"... just as we see questions and reports about the Atari Lynx, the Atari Portfolio, the Atari Video Games...

No, I don't think we'll get any "accurate" numerical data about how many ATW systems are in use throughout the world, but I think that if there were significant numbers of them, that we'd hear SOMETHING about them... more than three anyway... (or four...)

>postings should go.

Golly Craig... I'm sorry if your sexual problems have spilled over into
atari.whatever... good luck with whatever it is...

As far as "transputer problems", I've simply asked if anyone here on the
Net has any experience, or has heard of anyone who has experience with
the Atari Transputer Workstation...

I don't care it they've got a modem attached so they can post direct
responses right from the keyboard of an ATW, or if they have to punch
paper cards to send their response... the point is, in the entire
world, only three ATW installations have ever been reported here on
UseNet...

Actually, I really don't think *I* have to do anything to discredit
Atari, Corp... they seem to be doing a terrific job of it themselves...

Useful input, eh..? Have *YOU* ever helped anyone who needed to
transfer files from their UseNet connected mainframe to their personal
ST...? Have you ever directed anyone needing hard to get Atari products
to sources for those products..? Have you ever answered anyone's
questions about what to do on Level 8 of the Dungeon Master dungeon..?
Have you ever given anyone the address and phone number of the nearest
Atari User Group to their location so they can get some local support
and answers to their questions...?

Sorry Craig, I seem to have missed all your posts...

The Branch Always guys have a rewritten version of BIGSCRN, called MonSTEr,
that uses the STe's hardware scrolling. It came on my QuickST 2.1 disk.
It seems to work alright, but it has to be the first program in the AUTO folder.
(At least, that's the only way I got it to work...) I've found that using it
is more often a drag than not. (heh...) Any time a dialog box appears in the
center of the "screen", you have to scroll over to read it and hit the response
button... It's also incompatible with overscan, due to the way overscan sets
up the video memory. (Sigh.)

Is North America so unimportant to Atari, are we just a bunch of leperous
computer scum, that Europe gets a 32 Mhz press release while NA gets
a 16Mhz press release.

I don't flame anyone here, I just would like to know, what will be available
in November in North America. I'll just go and get one from Canada if the US
has no distribution.

Can someone from Atari gives us some concrete/gelatin facts/truths to this
impending release.

G'day,

{DISCLAIMER: the following is speculative {I think :-)}. The ideas are all a spinoff from this discussion thread. Please reply via e-mail if you see flaws etc and wish to correct the view taken. If you wish I could provide a summary to this newsgroup of constructive criticsm.}

I offer my apologies if my following remarks have been offered earlier. I have tried to read all the articles in this thread but I did not see ideas similar to those following.

I have seen earlier discussions similar to this one regarding ROM distribn of OS s/w (in com.sys.apple , yes the old group) except that they regarded RAM based secondary storage. There were dis-advantages with the technology however the basic idea goes thusly:

1. Have some type of battery backed up RAM

2. Load the s/w you use into it (of floppies say)

Wallah. You could make a survivable RAM based ROM system no? Perhaps put a h/w write-protect switch on it to. If the RAM were quick enough you could view this as shadow RAM for any existing ROM.

Disadvantages: probably many but primary is that the OS woud probably need changing to make good use of this. Secondary: why waste the RAM on storing the OS?

Advantages: well let's speculate :-). Apple like free DOS on a disk distn? Take the latest OS s/w home and copy it to the RamOS :-) device. I'll stop at that bad joke. :-)

PS: a minor nit with an earlier technical point re PCs with RAM based ROM. Most Amigas in existence use ROMs like Ataris do. The Amiga 1000 does not {but there are only a handful of them ... yeah I've got one :-) } and the Amiga 3000 currently does but the production ones will not.

Call me a pedant. :-) {I wish I had the money for a ROM system fix because it is a pain at times surviving on 400K user RAM. :-(}

yours truly,
Lou Cavallo.

>
> Looks like Atari is doing something good again! How long has the STe been
> available to the rest of the world?
> Or, how long of a delay has it been for the Ste to be available in the U.S.?
>
I first saw the STe in a London shop in mid-December 1989. The STe's arrived in England unannounced, as Atari UK had underestimated demand and had to hastily fly in a new batch of STs to meet orders from dealers. The new STs turned out to be STe's.

Some dealers in England are supplying 520STe's with added RAM. In some cases, this just involves adding 256k SIMMs, in others it involves removing the 256k SIMMs and slotting in 1mb SIMMs. As long as people want different-sized machines, I guess they're not left with too many spare 256k SIMMs on their hands.

I've now got a 2mb STe for less than the price Atari is asking for a 1040STe (449 pounds, as compared to 499 pounds list price for a 1040STe.) Now if only Megamax will hurry up and send me my Laser C upgrade (v2.0 doesn't like any TOS above 1.2).....

>
> 68030, 32 Mhz

(Lots of other specs deleted)

This is the second report I've seen quoting a 32 Mhz 68030 (the other one was from Norway, I think). It's starting to look like it might be real. An Atari UK person was very evasive when I asked at their recent show whether the TT as shipped would have just a 16 Mhz chip.

Maybe someone listens to user comments after all, just sometimes.

Now where's that extra expansion slot?

I was just at Toad Computers in Maryland and they had SIX STe's in stock. And guess what! Their selling price for the CPU only was just $590! The color system was going for $899, also.

There is one big problem with the STe's in america. THEY DIDN'T FIX THE BUGS THAT WERE IN THE EUROPEAN AND CANADIAN MODELS! They still boot up in low-res no matter what you set in the DESKTOP.INF file. They do include a patch for it, but that is no way to sell a new computer!

Message-ID: <9357d8f9af28267f9d80@canremote.uucp>
Source record: 240107

Thank you again to the many people who have responded to my ARGV= enquiry. I misunderstood the new Atari protocol because of the German Gemini 1.1, which uses it incorrectly (the way I described it in my initial posting). The ARGV= protocol looks very promising for the ST, and I will incorporate it into my startup code. Just to make things clear, this is the correct format for ARGV=

ARGV=<don't care>\0<av[0]>\0<av[1]>\0...<av[ac-1]>\0\0

Also, as Alan Pratt wrote, the length byte in the basepage must be set to 0x7f (I think). Hope this makes up for any confusion. Now, could someone explain XBRA (just joking).

From: bointon@kcl-cs.UUCP
Message-ID: <1049@xenon.kcl-cs.UUCP>
Source record: 240109

Please note that this is not a flame- just the truth!!
I have completely given up using WP-ST. It is so cumbersome and long winded
to install and use, and as sod's law decrees, my printer was not supported, so
I had to do my own printer driver (including the proportional space table).
The Spell checker and thesaurus are undoubtably very well done, and surprisingly
fast. Someone mentioned running it off a single floppy. The idea of this fills
me with horror- It's bad enough off hard disk! The actual final, finished
printout is not really any better than 1st word. For nice fonts etc I use
Signum 2, which has a particularly fast printer driver. Something I would like
to see is postscript output on EVERY WP (ok, so this may prove inconvenient).
I don't see how you could get it onto a single floppy- I cut out as much
unnecessary stuff as I could and it still took up 1.8Mb!
The final straw as far as I was concerned is WP's announcement a while ago
saying that they were pulling out of the ST market completely (in the UK anyway)
There were so many bugs in the original release that it was unusable (load prog,
load file, crash...), though to their credit, bug-fixes came out pretty quickly.

Sorry this is so scathing, but it did actually annoy me quite a lot.

Speaking of TT launch- when was the earliest one spotted?? I first saw one
last year (August?) at a computer show in London, and I know it had already
appeared the CeBit show in Germany... Looked pretty good running "Hard driving"
with better graphics than the arcade version.

so...

>
>I just have to say something here in support of Darek and Ignac (hope I
>spelled those correctly). Quick ST has had tremendous product support over
>period which it has exsisted, over two years now. It was originally done

As I have stated in a few postings to this newsgroup, I have left the company as a full time employee. I am still a developper for Branch Always since anything I develop will be marketed through Branch Always, and I will be paid royalties. Branch Always is still around, and as long as Turbo ST exists and is upgraded, so will Quick ST. In fact, Darek has told me that he has a preliminary TT version of Quick ST, giving about the same percentage speed increases as Quick ST for the ST does. Quick ST supports GDOS fonts, Turbo ST doesn't. Branch Always software has given quick and excellent support for people, no doubt about it. How many people will politely answer a message at 1 am in the morning from someone who has installed the product incorrectly in Australia???

As a company, Branch Always is dedicated in giving the user the best for the lowest price. That's all there is to it. Unfortunately, since Darek is currently in the process of moving to Seattle to begin his real job at Microsoft (boo hiss - the MSDOS people! :-) there's no one around to respond to questions. I sincerely hope that people out there can understand this current situation and not draw any hasty conclusions from it. Things should be back into full swing by about the middle of July, and I am currently trying to give as much help as I can when people phone in with problems, even though I am officially not part of Branch Always.

Branch Always is alive and kicking, and Quick ST (and soon to be Quick TT) will be there, as competetive as ever. I for one know that we have done more than SoftTrek has ever done (I have never received anything from SoftTrek about Turbo ST upgrades being available, except for 1 newsletter. Their upgrades are more expensive, and frankly, for the few percent difference in speed between Turbo and Quick, I think there is no question that Quick ST is better. unless some of you out there can really tell the difference between 1300% and 1305% or whatever the current numbers are.)

* YES, I was affilitated with this company, and I do not appreciate people spreading rumours that Branch Always did not give support. I am setting the record straight.

if you have to reach Darek, the easiest way is:

watcgl!compuserve.com!73657.2714

when attempting to reach him from Usenet. He's also DAREKM on GEnie.

Thanx for your time.

349. Pictures on the ST

Newsgroup: comp.sys.atari.st
Date: 1990-06-20 14:48:00 UTC
From: krieg@jupiter.uucp
Message-ID: <2701@mrsvr.UUCP>
Source record: 240112

I recently saw some IFF pictures on my friend's Amiga and was greatly impressed. They made most of the Spectrum pictures I've seen look like water colors. Is there a better graphics format than Spectrum for the ST? Does the Amiga 2000 have a higher resolution than the 520 ST? Is this a result of IFF displaying more colors or something?

I also have some GIF pictures I've been trying to view on my ST. I haven't had much luck with PD GIF viewers, so I used a GIF to Spectrum conversion program instead. Some of these GIF files were 100-200K, but the Spectrum pictures produced by the coverter were always around 51K. Needless to say, the resolution was horrible! Is this a fault of the conversion program?

Is there anyway to create/view high resolution color pictures on the ST that approach GIF and IFF? I've been very disappointed with what I've seen so far.

No, Europe is so important that they get all the false rumors.

Think about it for a minute -- how much does it cost to put a memory
subsystem into a 68030 box that can handle a 32mhz processor?

I really doubt that Atari is producing a 32mhz TT. So don't worry,
nobody else is going to get it either.

Sheesh.

I can hardly believe that the TT will come out with 16 Mhz in the US, and
32 Mhz in Europe. As far as I have read in several (european) magazines,
the TT will have a 16 Mhz (alas).

Ditto here at U of VT. There are no new sources here either, can
Steve Grimm reply or somebody else confirm the vacation theory? I
also have lost my "order" from the archive-server, sent in about 2
weeks ago.

On a related topic, which (mail server available or by mailed
<bought> disk) version of Lharc for the ST can unLZH GeminiUK? I've
had no luck with UNLZH1.4 or with the original Lharc from the
archive-server. I don't have lharc 1.13 yet and lharc2 got mangled
getting to me. I want to do an alternate desktop shootout! Please
email replies on this question - I will summarize results.

Lastly, what's the status of the terminator email service this week?
thanks,

>version of TOS, for only the cost of a drive to the local dealer...
>
>Just two comments...
>
>I like it... and it'll never happen...

The ORIGINAL Atari company liked it too. So much so that it was
incorporated into the design of the original Atari 800s. Pop open the
cartridge hatch, flip the two black levers and open. Voila! You had
access to the memory cartridges and the cartridge that held the
operating system. It made upgrading your 16K Atari 800 to 48K easy.
Also, when they switched from OS Rev. A to OS Rev. B, all it meant was
going to your dealer, BUYING a new OS cartridge, popping the old one
out and sticking the new one in. Considering the number of people who
own(ed) Atari 8 bits that now own STs, I'm surprised no one mentioned
this eariler. (Of course, when the 800s came only at 48K, they changed
the black levers to screws and took the casings away from the
cartridges.)

Maybe "it'll never happen" again, but it has happened before.

Source record: 240118

First, I'd like to thank everybody who wrote me about my Time Bandits question. I've finished the Excalibur and am now happily robbing other dimesions.

Does anybody out there know of an ARC-type program that will work on files compressed with a .ZIP extender? It's an IBM format, I think, and a couple local boardarchive all their files this way.

Also, are there any FTP sites that carry DEGAS-format nudes? I used to have a good sized collection and they were wiped out when a disk went bad and I'd like to rebuild it, if possible.

Once again, please reply via E-mail, to avoid cluttering the newsgroup.

Thanks!

About a year ago (1989) I got my hands on a version of Adventure which ran on the ST... I have since sold my ST, and I can't remember if I had sources with it, or just a binary, but the fact that a binary Adventure exists for the Atari ST suggests that the C sources are available.

I recently got the Fortran sources off of comp.sources.games.sources, but we don't have Fortran compilers on our Mac II's or Next machines.

I would appreciate pointers to these sources.

Thanks.

Ahhh. In other words, what you want is what Atari used to build into their 8-bit line, starting with the 400/800's, sort of. No, I don't mean the game-cart slot -- the OS itself, sveltely fitting into a meager 10K of ROM, was on a removable card/cartridge, alongside the memory boards. To my knowledge, no one ever did bring out a replacement/upgrade OS (though I think someone was selling user-installable replacement ROM chips that recoded the (floating-point decimal, wow! :-) math routines for better speed). They could've, though.

What you'd actually probably like is EEROM or battery-backed RAM in that cartridge; some technology that doesn't require opening the case to erase it as EPROMs would. That'd cost a bit more, though.

>got it now?

What you'd also then have is a Toy Computer, since clearly the IBM-wannabees don't have it. (Wan smile; just kidding.) Frankly, why not just build more RAM into the damn thing, admit that all future machines you sell are going to have reasonably fast hard-drives, install the OS there, and distribute patch-floppies periodically? Just because Apple seems to have trouble doing their OS upgrades that way (basing that comment on what someone else said here earlier about frequent, buggy revs; I don't have any firsthand experience that confirms it), doesn't mean that the idea is dumb.

John,

The disk based version of TOS 1.4 was available only while it was in development. Strictly a developer unit, and was bug ridden. The version that is in rom is much better. Try contacting a dealer like Toad Computers in Maryland. They advertise in lots of the mags, and usually offer the roms (uninstalled) for around $70.

regards,

Bob Brodie

> is dumb.

Well lately, Apples last 3 system upgrades have been done to support the new machines that they release which is almost faster than the OS releases. And while they're at it, they fix some bugs. I don't think the reason Apple releases so many versions is because they are buggy (except for 6.0). There really isn't much of a reason to run 6.04 on Spectre just because its latest (or 6.05 for that matter) because it doesn't give any advantages to us. It just makes Dave have patch up Spectre for us and take his time from other fun things... Wow that was a fun tangent :-)

Anyway, releasing new machines is something Atari really couldn't ever do in a timely fashion... They do it, just not fast enough.

Cheers,

Marshall

>Spectrum's capabilities? _Are_ there better converters or GIF viewers?

Ok, I've got to say something.... I love images-- I have a scanner.
I also have not had any problems converting GIFS and the images usually
look EXACTLY like the conversion file.

Of course, I ONLY CONVERT GIFS OF 320x200 SIZE!

I use pbm and other utilites to accomplish this task.

I also find that most images can be converted to 320x200 with 16 colors
and saved in IFF format. In this way I can get .p[ci]1 pics also.

With possible future pbm utilities for Atari formats, this process should
become painless. The conversion takes a while with the ST so I normally
a sun sparcstation (usually with a process reniced to -15 or so...)--
HOWEVER, I have not looked into to it, but it would be nice to get PBM to
compile under TOS AND MINIX ST!

>
> I've just become the proud owner of a Third Coast 65meg (ST277N ?) hard
>disk. My question is should it be putting FM interference ?? I get wide band
>interference (I can hear the drive's stepper motor) at about 6ft form the
>machine. A friend downstairs from me can pick up the drives noise output and
>he's about 30ft and 2 walls away from the machine. (He has a portable radio so
>the noise is not mains transmitted).
>
> Is my hard drive faulty ???

Seems the culprit is not the hard disk but the memory expansion I put
in over the same weekend. It's fun (??) listening to the memory accesses when
using the computer (The little guy seems to go wild when opening a window).
This still leaves me with the problem that my hard disk writes are unreliable.

> Is there anything I can do to shield it ???

I've Tried sheilding the memory expansion (which has to sit outside of
the shield due to size) this has a small effect, the <Sense $04>'s (Drive not
responding) become ALLMOST non-existant and <Write Fail $000n> become less
frequent.

The memory expansion is Xtra-Ram from Frontier Software, I've checked
it for missing capacitors and resistors, but cannot find any. Does anyone
else have any experiences with this expansion board.

I'm going to try toriod's on the power lines to try to filter the noise
out of the line. (If that's how it's transmitted).

Are there any problems with power losses from the MMU or DMA chips
when expanding memory. The computer is a 2 year olf 520STFM and the memory
board requires a plug into the top of the MMU and the removal of the Shifter
from its socket and insertion into a board which plugs into the shifter
socket. Power is taken from one of these two connectors. The earth wire is
attached to the earth wire input on the mains lead.

++ >done this? I'd probably need more memory.

++ Don't even try, unless you have 10-20 Mbytes of memory(and running unix)
++ most OO extension run on top of common lisp

Hang on, how would that chime with Procyon (a UK mob) offering an package of Procyon CL *and* an implementation of CLOS, for the Mac? I haven't taxed them directly about what a sizeable OOPS application in CLOS would consume, but 10-20 Mb seems a little severe.

I suspect that some unix CL implementors assume 8-16Mb of RAM, with 100+Mb of store, allowing them to go for process sizes of up to 40-60Mb and image sizes of tens of Mb. Other implementations (I'm thinking of Poplog, here) don't require anywhere *near* as much system beef.

> address on this message. Thanks.
>

It seems that my mail didn't reach you. So i decided to reply to the net.
Here is my original reply:

The official atari specification is virtually the same as that used by MWC:
ARGV=<ignored-stuff>\0<av[0]>\0<av[1]>\0 ... \0<av[n]>\0\0

There was an older proposal by Allan Pratt in the Pexec-cookbook that had
argv[0] immediately following the string "ARGV=". This proposal also specified
a PBP environment-variable with the parents base page pointer encoded as a
decimal number.
Another way to distinguish the two methods is to look at the length-byte in
your own basepage. The official standard sets it to 127, which is an otherwise
not occuring value.

```
*****************************
HOW TO TEST DIFFERENT METHODS
*****************************
```

If you want to test your programs with different parameter passing methods, you
can run it under the Master-Demo posted some time ago on comp.binaries.atari.st.
The relevant status-variable is XARGS. It is treated as a bit-vector with the
following interpretation:

```
Bit | Meaning
--------+-----------------------------------------------------------
0 | use PBP/ARGV parameter passing
1 | use MWC-ARGV parameter passing (value of ARGV is io-vector)
2 | use xArg environment var (points to xArg-struct)
```

3 | use length-byte 127 for validation

The methods may be merged (XARGS == 3 means use PBP/ARGV + handle 2 as console). If PBP is not used (XARGS & 2 == 0), the environment-variable $ contains the hexadecimal encoding of the parents basepage. Another status-variable affecting the passing of environment-vars and thus the extended arguments is UNIX. If the variable is set (to any value), the environment is passed in the form:

var1=val1\0var2=val2\0 ... varn=valn\0\0

If the variable is not set (or has the value "0"), the environment is passed in the form:

var1=\0val1\0var2=\0val2\0 ... varn=\0valn\0\0

Xlisp, Xscheme & fools are small (~100k) lisp systems with OO extensions
on the ST, available on terminator.

Xlisp is used for real applications in the unix world, is robust and has
good OO support, debugger & extensibility from C, and is common-lisp compatible

>> and another ...

>>>] Atari Norway just told us that the TT will be delivered with not a 16 but
>>>] a 32 Mhz !!!

>>Is North America so unimportant to Atari, are we just a bunch of leperous
>>computer scum, that Europe gets a 32 Mhz press release while NA gets
>>a 16Mhz press release.

>I can hardly believe that the TT will come out with 16 Mhz in the US, and
>32 Mhz in Europe. As far as I have read in several (european) magazines,
>the TT will have a 16 Mhz (alas).

Look folks, computer sales people are notorious for giving promises of
delivery. Whether this is due to naievity or knavery, one can only guess.

It is also possible that some new person with no experience got mixed
up about the difference between Mhz and bits.

In any case, don't get your knickers in a knot about stuff like this.
It is not worth it.

>one, then you know EXACTLY what they have, despite the ROM. There
>would be no excuse for the user to not upgrade (it's free).
>
>I suggested it, but Atari didn't like it. C'est la vie.

Well I second Greg's suggestion. We have a lab full of TOS 1.0 and so I have
wanted a 'panacea' ROM patch for a long time. Sure I prefer the unbugged
ROMs but until we upgrade the lab we could use the patch. The patch should
only fix bugs and not add features (eg. Move File, Skewed Disk Format etc)
else some people would never buy the ROMs. It should also take its patches
from a file and only install the ones needed.

With regard to bugs in TOS 1.4 and TOS 1.6, I recall Ken Badertscher some
time ago calming our fears about a rare bug that hit Leonard Tramiels HD
and set back the release of TOS 1.4.

>From: kbad@atari.UUCP (Ken Badertscher)
>Date: 8 Mar 89 08:12:44 GMT
>Organization: Atari Corp., Sunnyvale, CA
>In point of fact, it was a very unusual bug, and to his immense credit,
>Leonard is such a perfectionist that he would not allow TOS 1.4 to be
>released even with such a obscure, rare bug in it!

I'm sure we all appreciate that, but once TOS 1.4 was released some not so
obscure bugs were found and although Atari have since released patches they
seem to have no plans to fix the ROMs and re-release them.
Some people have also cast doubts on the efficiency of the patches too.

TOS 1.6 was released in the ROM of the STE with bugs that Atari did feel
deserved an unbugged re-release. Do we 1.4 owners not deserve the same?
I suspect that Atari feel that the Medium Res bug, although trivial, is more
important because it's a visible one. "Hey look, I'll show you a bug!"

It is sad to think that TOS 1.4 is now available in the UK over one year after
it was finished. I would have been nice to have at least gained something from
the delay like bug fixes.

The TOS ROM versions situation currently looks like this:-

BOOT ROM:
Version: 0.0
Machine: 260-1040 ST
Size: 64K
Release date: Unknown (and unimportant)
This was the first ROM. It's sole purpose was to supply just enough BIOS
calls to enable RAM TOS to be loaded from disk. Nice picture though.

ROM TOS:
Version: 1.0
Machine: 260-1040 ST
Size: 192K
Release date: 20th November 1985
Initially available on disk as RAM TOS this is the original buggy OS
(I call it BUG TOS :-) It is believed most of the bugs seem to have been
DRI's fault.

BLiT TOS:
Version: 1.2
Machine: 520-1040 ST, Mega ST
Size: 192K
Release date: 22nd April 1987
Changes: A few minor bug fixes plus a few new features (mainly BLiTTER support
for Mega ST's)

Rainbow TOS
Version: 1.4
Machine: 520-1040 ST, Mega ST, STacy
Size: 192K
Release date: 6th April 1989
Changes: Major bug fixes plus many more new features. Some bugs were left in
for compatibility reasons. New ones appeared. Called Rainbow TOS because of
the rainbow colours in the fuji logo from "Desktop Info" menu.

Rainbow/STE TOS
Version: 1.6
Machine: STE
Size: 256K
Release date: 29th July 1989, 17th October 1989
Changes: Essentially this is TOS 1.4 with new features added because of
larger ROM space and enhanced hardware. The TOS 1.4 bugs were fixed.
It was re-released because of desktop.inf med-res bug.

TOS030
Version: 2.0?
Machine: TT
Size: 512K
Release date: Unknown at present
Changes: Rumoured to be major improvements and new features. This is probably
the most bug free ROM version to date (whatever it is).

It begins too look like TOS 1.4 is the end of the road for the ST, Mega ST and
STacy portable. The STE gets one more bite at the cherry with a possible

TOS 1.8 and the TT looks set to get all the future improvements in 2.0 and greater.

SO VOTE NOW FOR THE PANACEA OF TOS PATCHES AND RE-RELEASED ROMS!

GEMDOS calls are trap #1.
BDOS calls are trap #2. (Apparently used internally by the operating system.)
BIOS calls are trap #13.
XBIOS calls are trap #14.

>on a removable card/cartridge, alongside the memory boards. To my knowledge,
>no one ever did bring out a replacement/upgrade OS...

God, I'm really gonna show my age here, but...

as a matter of fact, there were _at least_ two substitute OS cards for
the 800: one was Dave Small's OS board which made the Corvus hard
drive for the 800 actually work really well (I just gave away Dave's
age, too, ;-), and the other was a board out of Atari, which put
the debugger DDT into the unused 4K address space which was in the
OS map. Both of these cards were very much 'specialty' cards--
the average 800 user had no need of 'em, but if you were doing
software development on an 800, they were worth their weight in gold.

Jeez, next thing you know I'm gonna start rambling about the 'good
old days'. I better go out and shoot myself immediately. :-)

>(At least, that's the only way I got it to work...) I've found that using it
>is more often a drag than not. (heh...) Any time a dialog box appears in the
>center of the "screen", you have to scroll over to read it and hit the response
>button... It's also incompatible with overscan, due to the way overscan sets
>up the video memory. (Sigh.)

the reason dialogs appear in the middle of the screen is because they
are always PROGRAMMED to be there. not darek's, atari's or anyone's fault.
that's just the accepted way of showing dialogs - put them in the middle
of the current resolution's screen, and if its BIGSCRN or MONSTER running,
the middle of the screen is NO LONGER the middle of the 640 by 400 resolution
now is it?

(needed to say this before anyone thinks that it was Branch Always Software's
fault!) :-)

I guess ATARI will come up with a cache solution, that is, the processor will run at 32 MHz while the whole rest will stay at 16 Mhz. This can be done pretty cheaply. Personally, I believe in this rumour. ATARI has to do something against the A3000 which is, IMHO, technically the better machine.

Source record: 240269

XLISP 2.0 is PD, has full OOPS capabilities, and runs fine in 1 meg. It is robust and portable (it has been ported to just about every CPU). On the LISP side, it runs a subset of the Common LISP language (some of the picky little things, and a few big things are missing). The manual is good, and I think that there are now trace facilities available. The (system) command works, so it is easy to drop in and out of the editor.

XLISP comes with full C source if you want to modify it. Any more questions?

Well, who says all future machines will have reasonably fast hard drives?
I was using my 1040 with only floppies for about 3 years before I bought
a Hard Disk for it.... Now that I have one, I couldn't survive without
one, but I managed ok for a while... It is quite nice of Atari to be able
to cator to both the home users (one of which I was) who can't afford such
extravagances, and the power users (one of which I am now) who go for such
things.

From: chris@tharr.UUCP
Message-ID: <791@tharr.UUCP>
Source record: 240258

We have been producing a hard disk for the ST for some months now.
The hard disk uses an interface which has been designed in Germany
and is software compatible with the official Atari hard disk.

The problem is that on many STe machines, corruption of data happens.
It always happens in the same way - two bytes are missed out when
a sector is written to the disk. eg

this is a piece of text
becomes
this is a pce of text

This is disastrous when it happens to directory sectors and programs.

Point 1. This only ever happens on the STe

Point 2. Replacing the DMA chip with one from an STFM usually solves
the problem.

Point 3. We sent an STe & a Hard Disk with this problem to the
manufacturers of the interface in Germany. They said that the same
problem was happening with the Megafile and with the ICD Interface.

Point 4. This is happening with about one in four STe machines.

Atari UK say they have not heard of this problem and they are not
interested.
Has anybody... Atari USA? Anybody else? come up against this problem?
Our supplier has run our of "OLD" DMA chips and is now sending us
"NEW" ones which have the same problem. Can anybody suggest a solution?

frustratedly,

chris.

From: kgg@zinn.MV.COM
Message-ID: <771@zinn.MV.COM>
Source record: 240274

There is a thing called Xlisp that is an implementation of Common Lisp
with object-oriented extensions. I believe that it's as close to
Common Lisp as the author could reasonably make it, but don't beat up
on me if it diverges here and there. It is written in C, and I'm
quite sure that it has been compiled and run on the Atari 1040 ST.
I'm interested in getting a copy of it myself, but haven't had the
time to track it down and download it. An ancient version of it
used to run on a 60kb (!) PDP-11; it eventually grew large enough
that it would no longer fit, but I think that you should have no
trouble getting it to fit in 1Mb. Documentation is, I think, adequate.
There is even a paperback book written about it (by someone other
than the author of Xlisp itself). I've seen indications that it's
available from terminator. Maybe someone would be willing to fetch
it off and forward it to you.

Also, look in the latest issue of /Personal Workstation/ magazine.
There is a two-part article (concluded next month) describing how
to implement your own OO package in C.

Hi. You may know me as the Toad guy. But anyway, the reason I'm here. I'm rather new to C programming and I need to know how to do something very very simple. POKING. I've got the STE, and I'm trying to get it to play a sample. According to the Atari Developer information, all you have to do is set up some info in these new funky swell registers, and awaay we go. But, my problem is getting the right values into the registers. Example: Suppose I want to put the value 10000011 (binary) into the location FF8920. How, in the name of Jack Tramiel am I to do this? What's the deal? How do I define that address in C specifically. Please help. Call me dumb, but I'm confused, and willing to listen. I looked through all my C manuals and couldn't find it. EMAIL HELP to dtrojh@jhunix.hcf.jhu.edu. Thanks.

I recently received information that the incompatibility of Gulam with TOS1.4
is limited to the 'mem' command. It seems that Gulam uses a undocumented TOS
routine or variable and apparently this has changed with TOS1.4. I got myself
a somewhat newer Gulam version (also a 1.03.xx ) and this seems to work fine
with the 'mem' command as an exception. Probably my first Gulam was not
O.K. in the first place.

The first TT seen in Germany probably was the prototype that was shown at the
CeBIT 1989 to selected developpers. Then, it had severe difficulties with
its shifter, the floppy I/O routines didn't work if you didn't switch off
the cache, and it couldn't even draw the bombs correctly. No trace of
the ugly case of today then - just an AT housing with a 44 MB removable
hard drive.

>
>I suggested it, but Atari didn't like it. C'est la vie.

Well I second Greg's suggestion. We have a lab full of TOS 1.0 and so I have
wanted a 'panacea' ROM patch for a long time. Sure I'd prefer the unbugged
ROMs but until we upgrade the lab we could use the patch. The patch should
only fix bugs and not add features (eg. Move File, Skewed Disk Format etc)
else some people would never buy the ROMs. It should also take its patches
from a file and only install the ones needed.

With regard to bugs in TOS 1.4 and TOS 1.6, I recall Ken Badertscher some
time ago calming our fears about a rare bug that hit Leonard Tramiels HD
and set back the release of TOS 1.4.

>From: kbad@atari.UUCP (Ken Badertscher)
>Date: 8 Mar 89 08:12:44 GMT
>Organization: Atari Corp., Sunnyvale, CA
>In point of fact, it was a very unusual bug, and to his immense credit,
>Leonard is such a perfectionist that he would not allow TOS 1.4 to be
>released even with such a obscure, rare bug in it!

I'm sure we all appreciate that, but once TOS 1.4 was released some not so
obscure bugs were found and although Atari have since released patches they
seem to have no plans to fix the ROMs and re-release them.
Some people have also cast doubts on the efficiency of the patches too.

TOS 1.6 was released in the ROM of the STE with bugs that Atari did feel
deserved an unbugged re-release. Do we 1.4 owners not deserve the same?
I suspect that Atari feel that the Medium Res bug, although trivial, is more
important because it's a visible one. "Hey look, I'll show you a bug!"

It is sad to think that TOS 1.4 is now available in the UK over one year after
it was finished. I would have been nice to have at least gained something from
the delay like bug fixes.

The TOS ROM versions situation currently looks like this:-

BOOT ROM
Version: 0.0
Machine: 260-520 ST
Size: 64K
Release date: Unknown (and unimportant)
This was the first ROM. It's sole purpose was to supply just enough BIOS
calls to enable RAM TOS to be loaded from disk. Nice picture though.

ROM TOS
Version: 1.0
Machine: 520-1040 ST
Size: 192K
Release date: 20th November 1985
Initially available on disk as RAM TOS this is the original buggy OS
(I call it BUG TOS :-) It is believed most of the bugs seem to have been
DRI's fault.

BLiT TOS:
Version: 1.2
Machine: 520-1040 ST(FM), Mega ST
Size: 192K
Release date: 22nd April 1987
Changes: A few minor bug fixes plus a few new features (mainly BLiTTER support
for Mega ST's)

Rainbow TOS
Version: 1.4
Machine: 520-1040 ST(FM), Mega ST, STacy
Size: 192K
Release date: 6th April 1989
Changes: Major bug fixes plus many more new features. Some bugs were left in
for compatibility reasons. New ones appeared. Called Rainbow TOS because of
the rainbow colours in the fuji logo from "Desktop Info" menu.

Rainbow/STE TOS
Version: 1.6
Machine: STE
Size: 256K
Release date: 29th July 1989, 17th October 1989
Changes: Essentially this is TOS 1.4 with new features added because of
larger ROM space and enhanced hardware. The TOS 1.4 bugs were fixed.
It was re-released because of desktop.inf med-res bug.

TOS030
Version: 2.0?
Machine: TT
Size: 512K
Release date: Unknown at present
Changes: Rumoured to be major improvements and new features. This is probably
the most bug free ROM version to date (whatever it is).

It begins too look like TOS 1.4 is the end of the road for the ST, Mega ST and
STacy portable. The STE gets one more bite at the cherry with a possible

TOS 1.8 and the TT looks set to get all the future improvements in 2.0 and greater.

SO VOTE NOW FOR THE PANACEA OF TOS PATCHES AND RE-RELEASED ROMS!

What's about the first object oriented language - SIMULA - as an
alternative ?

It's still up to date, and can run on simple 1040 ST with one disk
drive!!

I append an abstract about the system from the SIMULA-Team in Germany.
The contact address is included at the end.

Here it is:

SIMULA for Atari ST

If you want to do object oriented programming you definitely
should have a look at SIMULA. SIMULA is the first and still the
most advanced object oriented programming language available on a
wide variety of machines *including* the Atari ST (see below).

SIMULA in a nutshell
====================

o Conventional general-purpose algorithmic capability in the
style of ALGOL 60.

o Object-oriented programming (classes) encompassing
encapsulation, inheritance, information hiding, autonomous
activity and strong typing supporting the concepts of
modularisation, generalisation, specialisation, abstraction,
polymorphism and pseudo-parallelism.

o Basic features for manipulating text strings.

o File concept supporting sequential and direct access methods
for byte- and record-structured files.

o Large repertoire of utility functions.

o Features supporting 2-way linked lists. More complicated
list structures such as trees and lattices are easily
constructed from the basic class facilities.

o Features supporting discrete event simulation in various
styles including the object-oriented process view.

It should be emphasised that although in many quarters SIMULA is
best known for its simulation features it is a truly general-
purpose language in the widest sense and was the inspiration for
almost all developments in the field of object-oriented
programming.

What you get with each SIMULA system
====================================

o Object oriented programming. A typical SIMULA program
consists of a set of interacting processes or *objects*.
Objects are incarnations of some prototype or *class*,
generated (and later perhaps terminated) during the
execution of the program. In this manner a program written
in SIMULA may map the problem solution conveniently and
cleanly.

o Strong typing, checked mostly at compile time, ensuring
that objects are manipulated in a manner consistent with
their specification.

o Objects may act independently of each other in "quasi-
parallel". This enables the class objects to act as
coroutines, so that the action of one object may be
temporarily suspended, later to be resumed at the exact
point of suspension. Coroutines facilitate a faithful
representation of systems composed of both passive and
active objects. This feature is an extra dimension
to those commonly associated with object-oriented
languages and is only recently beginning to appear in
some of the newer ones.

o List processing. The class "Simset" may be applied to add
list processing capabilities to the language. The programmer
will then have tools for the efficient manipulation of common
aggregate information structures, including queues. The
facilities of Simset can be further refined for more
specialised purposes.

o Simulation. Application of the built-in class "Simulation"
extends SIMULA to a powerful tool for discrete event

simulation in a style which preserves in the model the inherent structure of the system under study.

o Powerful text handling, dynamic arrays, flexible file handling, etc.

o Modularisation. Separate compilation of classes and procedures is an integral part of the language. The strong typing extends to separately compiled modules allowing the partitioning of large SIMULA systems into subtasks, which may be assigned to different work groups, without fear of undetected incompatibilities.

o SIMULA has a rigid standard definition and programs are highly portable between different computer systems (source code compatibility).

Some properties of the SIMULA system for the Atari ST
==========

o Full SIMULA language standard.
(Currently the only restriction is that the switch is not yet implemented. Also you might expect a better accuracy from software emulation for real arithmetic.)

o Implementation based on the well-known Lund SIMULA System for UNIX machines and others.

o Compact implementation. The complete system fits on one double-side disk.

o Economic. The compiler needs less than 1 MB even when compiling modules consisting of more than one thousand source lines.

o Fast. Compilation speed of approximately 1000 source lines per minute. The execution speed is comparable with that of other high-level languages.

o Complete interfaces to TOS and GEM.

o Separate compilation of different modules with consistency checks at compile time.

o Compatibility. Runs on all TOS versions and all types of keyboards. Call interface for external procedures written in other languages (currently supported: assembler - under development: C). Uses Sozobon's jas and ld, alternatively Atari's MadMac and aln (on request also GST).

o Symbolic debugger (source-code debugger) is under development.

401. STe Hardware Scrolling (again!)

Newsgroup: comp.sys.atari.st
Date: 1990-06-22 10:39:16 UTC
From: aimd@castle.ed.ac.uk
Message-ID: <4858@castle.ed.ac.uk>
Source record: 240271

Hi, I couple of days ago I described my problems getting the hardware scrolling on my STe to work properly. But got no reply.

There must be people who have got this working! Pleeeeaaaseee, tell me why all sorts of weird things happen with the left and right border as soon as I set HSCROLL!

I'd be forever grateful!
Mark.

402. STe "Fiasco"

Newsgroup: comp.sys.atari.st
Date: 1990-06-22 10:47:05 UTC
From: fsdmb3@acad3.fai.alaska.edu
Message-ID: <1990Jun22.104705.5295@hayes.fai.alaska.edu>
Source record: 240266

Sorry about not reuseing somebody elses important satement about things not running on there STe.... but I am new at this.

1) 1040STe's can be purchased from J&R Music World in New York (1-800-221-8180) for $600.
And they have the lowest price on the Porfolio that I've seen, $300!

2) I Have read in March ST Format, a leading British Mag. that the STe (which was released at Christmas time) Doesn't run a lot of heavily copy protected games. 30 are listed in the Mag, including Populous, Speedball, and Captain Blood. But it also won't run STOS or 1st Word!

Atari admitted in "New Computer Express" that ONE in 20 games wouldn't run on the STE. They also released a patch for the medium resolution booting problem. Since Christmas STOS has been said to have been fixed to work with the STE.

Most problems seem to stem from the use of undocumented "features" of TOS. Many public domain programs are said to also be incompatable.

I wouldn't be too shook up though, this is old news and some of it may have been fixed for the North American release... though I wouldn't hold _MY_ breath.

403. Writing ST floppies on a SUN SparcStation (Need help).

Newsgroup: comp.sys.atari.st
Date: 1990-06-22 10:57:00 UTC
From: rmh@planet.bt.co.uk
Message-ID: <1990Jun22.105700.5878@planet.bt.co.uk>
Source record: 240267

I am attempting to use a SUN Sparc Station 1 to put files from the Net onto 720k floppy disks for use on my ST. I have been using the MTOOLS (with the 3 patches) software to write PC compatible files on the SUN, but these are not correctly read by the ST.
The files seem to be OK when read on a PC, but on the ST the first couple of sectors are repeated thoughout the file. I suspect that there is a problem with the FAT formats used; can anybody explain the problem or suggest a fix.

I recieved an E mail response on this as a reply to a previous question I
posted. The author (sorry can't remember who) said that the STe DMA driver is
of a lower power than the original ST driver and a simple fix involves
simply making the Drive cable shorter than 1/2 a meter.

I have not tried this yet as I do not yet own a hard drive for my STe.

Hope this is of help.

405. How to get uniterm to change colors

Newsgroup: comp.sys.atari.st
Date: 1990-06-22 12:59:42 UTC
From: mreiss@ncrcam.Cambridge.NCR.COM
Message-ID: <1901@ncrcam.Cambridge.NCR.COM>
Source record: 240281

O.K., I know that I did this once long, long ago ... it seems to me that even when I did do it, it was by accident and I've never been able to do it again. But once, I changed the colors that uniterm defaults to. Now I have upgraded uniterm and I get the colors it wants to give me (black and white). Does anyone know how to change the program to let me pick the colors I want. Seems to me it should be a fairly simple thing to do. If all else fails, I'll even take a patch --- I hate black and white.

Seems to me with all the other options this program has, this one is probably in there also, I just can't find it.

406. PC-Ditto II vs PC Tools 6.0

Newsgroup: comp.sys.atari.st
Date: 1990-06-22 13:19:21 UTC
From: pv9y@vax5.cit.cornell.edu
Message-ID: <4334.2681e299@vax5.cit.cornell.edu>
Source record: 240284

Hi All,
Has anyone tried to run PC Tools Deluxe 6.0 on the PC Ditto II?
I've been trying and having little luck for no apparent reason.
First some of the files wouldn't uncompress, although they did
fine on another PC. Then the PCBackup program wouldn't recognize
some backup disks I had made on this other PC even though the
PCBDIR.COM program did identify them as PCBackup disks. Then
DISKFIX hung the system whenever it tried to do much of anything.
PCBackup failed to identify the hardware when it tried as well,
locking up the computer.

I've also had trouble getting Quattro Pro to install, although
PC-File and Norton 4.0 seem to run fine. Any ideas?

Please email me since I seldom get a chance to read this group any
more. Thanks!

Adam

(load prog,
> load file, crash...), though to their credit, bug-fixes came out
pretty quickly.

I am sorry you have had so much problems.
I had no problem running it off a single floppy (SS!)
and 1 meg RAM (with RAM disk as part of RAM).
It took a little to get it installed (true) but that was a
one shot deal. My printer was also not in the support
list at the time but I was able to modify another one to
give me real good service.

I just talked to them (WP) yesterday and asked about
the Atari version. The last release was October 89
and he said that there would be another Atari release
at the end of this coming July (90). They seem to still
be in the ST market, though the ST probably doesn't
deserve it. Though it wouldn't surprise me if they
only have one programmer working on it (maybe not
even all the time ?).

Anyway, the WP number in US is:

800-321-5906 for general info
the Atari WP technical support number is
800-321-3271

just a satisfied WP owner

According to a dutch magazine, this is because the manufacturer of the
floppydisk-controller (Western Digital) only has an 8 MHz version. They
are working on the 16 MHz version of the controller, which will support
1.44 Mb.

>There's a nice simple, no bitching question for you.

cool!

anyways, TOS 1.4 and higher, i believe, check a new system variable which
indicates to the ROM exception handlers what type of stack frame to
look out for. Thus i think TOS 1.4 will run correctly on the TT. (which
is rumoured to be shipped with TOS 1.4 anyways)

and yes, pretty well all trap handlers are going to break under the TT
because of this fact.

415. 68000 assembler

Newsgroup: comp.sys.atari.st
Date: 1990-06-22 23:47:55 UTC
From: peewee@ucschu.ucsc.edu
Message-ID: <4612@darkstar.ucsc.edu>
Source record: 240296

I have been scouring the archives in the bay area for a 68000 assembler.
The best thing I could find was version 1.00 of a68, a pre-release.
Unfortunately, it is very strict, and as a result, none of the
sources I get from Usenet compile!

The biggest problem is that it chokes on bra.s type instructions
and insists on indicating sizes in indexed addressing mode.

Can anyone point me to a share-ware/ public domain assembler that is usable?

(Not that I can't use this one for my own programs just fine.)

If there isn't such a thing, does anyone know a mail-order (wait-forever)
place who carries a good one?

Thanks much...

Date: 1990-06-23 01:14:36 UTC
From: opielask@clutx.clarkson.edu
Message-ID: <1990Jun23.011436.16176@sun.soe.clarkson.edu>
Source record: 240285

I put four 1 meg by 8 chip 100ns SIMMs into my 1040STe and have had no problems accessing the 4meg they give me. They were part of a standard Macintosh memory upgrade kit. You must get EIGHT chip SIMMs (like the Mac needs) for your STe, NOT NINE (Like the IBM needs) or TWELVE(like the DEC Rainbows need).
The extra chip on the 9 chip SIMMs lets the computer detect most memory access errors, (Due to solar flairs or a disturbance in the force, or just because it wanted to flip!) because it holds the parity bits.. The 12 chip SIMMs have the extra 4 chips to not only DETECT the errors, but to even CORRECT them!!

I purchased TWO:
MICRON TECHNOLOGY, INC.
PC Enhancement Product
Xceed 2MB Memory Expansion Kit(s)
for Mac II SE/Plus (Low Profile)

They have worked perfectly for me, and people are wondering what works.
This is the reason I am bringing this information forward.
I'm not a "I liked it so much I bought the company" ...

AAron nAAs (Anyone want to buy 4 256k X 8 150ns SIMMs ??)

My first message got messed up. Here is what I want to do :

Simulate outer space with stars streaking by. Either a head on view
with the stars comming at you, or a side view with the stars streaking
past. Also how do you program the ST sound chip? and how to make and move
sprites on the ST?

Thanks..
Jeff Bilger

>hard drives..
>
>WE have just barely gotten our first shipments of STeS! if you guys who have
>had them for 6+months havent solved the problem yet..

I have just been told of a fix for the problem. It is in the form of "Atari
Technical Note 070" which is very carefully worded. It admits of a problem
with the STe [thanks guys!] but refuses to assign any of the blame to Atari :-)

The fix involves putting a capacitor across two pins on the CPU, linking
a pin on the shifter to a pin elsewhere on the motherboard, and replacing
a resistor pack.

Now maybe I can sort out all these furious customers... One guy has had three
different STe's and four different hard disks... Each time he lost all of his
wordprocessing :-(

421. SIM City

Newsgroup: comp.sys.atari.st
Date: 1990-06-23 14:49:37 UTC
From: cr1@beach.cis.ufl.edu
Message-ID: <23640@uflorida.cis.ufl.EDU>
Source record: 240291

Well, I have been playing the Atari ST version of SIM City for several days now. It is awesome! All of you should go out right now and get it. It runs in low res, all the colors you know. Basically it is the same as the PC version--a few minor differences, none of which I can think of off hand. The only thing I don't like about it is that copy protection. It is text protected, and the sheet you have to look up the data on is a redish color with redish print on it. Try looking up THAT in the dark...or even in the light! Does anyone else have any comments on the Atari version of this game?

[]
A note for those who have downloaded my three Pagestream fonts
from comp.binaries.atari.st ["pstfonts"]: I've been told that the
Winslow Black font may not work on Apple Laserwriters. (It worked when
I tested it on another brand of Postscript printer, though.) This
is probably due to the font being built so strangely... Also, Winslow
Black italics may be a little misaligned on some printers due to
a PageStream bug. (It prints beautifully on my DeskJet, anyway.)

I haven't had any problems reported with the other two fonts
in the distribution. (Kibo Sans and Tyme Unslanted Italic.)

Sorry about that. Let me know if anything bizarre happens when
you try the fonts on your system.

A copy of the 68030 manual is totally essential, the stack frames are
completely different, and include stack format information which is
just not present. I don't now of any debuggers which will work,
although it is generally a simple task to take into account these
things.

Alex.

>
>There's a nice simple, no bitching question for you.
>
The exception stack frame changed with the 68010/68012 processors. Among
other things, the new format allows virtual memory support which did not
exist on the 68000. User mode operation is, of course, mostly unaffect.

The differences between the 68000 and its sucessors can be summed up in the
inclusion of the format/vector offset word.

68000 68010++

```
_____________________________________ _____________________________________
|________STATUS_REGISTER________| |________STATUS_REGISTER_________|
|_____PROGRAM_COUNTER_HIGH______| |_____PROGRAM_COUNTER_HIGH_______|
|_____PROGRAM_COUNTER_LOW_______| |_____PROGRAM_COUNTER_LOW________|
variables follow |FORMAT_|_____VECTOR_OFFSET______|
|_______other information________|
|_____depending on exception_____|
variables follow
```

The FORMAT field is four bits in length and defines the length of the stack
frame. Of the possible formats, two are defined for the 68010.
0000 Short format: Stack frame is four bytes in length.
1000 Long format: Stack frame is 29 bytes in length

"The number of words actually stacked depends on the exception type. Group 0
[Address Error, Bus Error but not Reset] stack 29 words and group 1 (Trace,
Interrupt, Illegal Instruction and Privledge violation) and [group] 2
exceptions (TRAP, TRAPV, CHK and divide by zero) stack four words. In order
to support generic exception handlers, the processor also places the vector
offset in the exception stack frame. The format code field allows the RTE
(return from exception) instruction to identify what information is on the
stack so that it may be properly restored. ... Although some formats are
peculiar to a particular M68000 Family processor, the format 0000 is always
legal and indicates that just the first four words of the frame are present."
- _M68000 8-/16-/32-Bit Microprocessors Programmer's Reference Manual_
fifth edition, pg. 4-7

Well the PC-VGA version is pretty attractive too, but the monochrome
MAC version still seems to be the best(in my opinion). The button usage
and windows are just a little clumsy after playing the Mac version. I wish
there was a monochrome version that had the same feel as the Mac version.

Overall, Simcity the game gets stale after a while.. I have built megalopolis' and then put
it away(Mac). I think they made the city list/data sheet
red so you cannot photocopy, pretty smart if you ask me.

>Point 1. This only ever happens on the STe
Similar problems can be observed with newer MegaSTs.

>Point 2. Replacing the DMA chip with one from an STFM usually solves
>the problem.
The IMP DMA chip seems to be out of specs. ATARI will never say:
Look, we've got this problem in the new DMA chips, sorry folks,
do this and that to cure the problem. At least, any comment I
heard from them concerning this desaster sounded like "Never
heard before" or "You must have a faulty drive" or "Your driver
is not the official one. Use ours".

>Point 3. We sent an STe & a Hard Disk with this problem to the
>manufacturers of the interface in Germany. They said that the same
>problem was happening with the Megafile and with the ICD Interface.
True.

>Our supplier has run our of "OLD" DMA chips and is now sending us
>"NEW" ones which have the same problem. Can anybody suggest a solution?
Sometimes replacing GLUEs in the MegaSTs will help. Unfortunately,
the STE has an integrated GLUE/MMU so you can't use any "old" chips.
Try fiddling around with the 16 MHz clock coming from the shifter.
Sometimes, it seems to be slightly out of phase or distorted.
Just a vague tip I got from some technician...

ignac@electro.com (Ignac Kolenko) writes:

>cool!

>anyways, TOS 1.4 and higher, i believe, check a new system variable which
>indicates to the ROM exception handlers what type of stack frame to
>look out for. Thus i think TOS 1.4 will run correctly on the TT. (which
>is rumoured to be shipped with TOS 1.4 anyways)
TOS 1.4 doesn't check anything. TOS 1.6 does. The TT will come TT 030
which is more like TOS 1.6 than TOS 1.4.

>and yes, pretty well all trap handlers are going to break under the TT
>because of this fact.
The 68030 places two additional bytes on the stack if I remember this
right. If you want to read out your function parameters on the trap
stack, you'll have to adjust your frame pointer like this:

```
movea.l a7,a5
lea offset(a5),a5 ; adjust a5 for 68000 trap
tst.w processor ; flag that tells you whether there's a 68030
beq.s goon
addq.l #2,a5
goon:
...
```

Just to show the principle...

Guess what... It didn't work! It didn't make the slightest bit of difference.
Sectors still getting corrupted all over the place in exactly the same way
on 3 different makes of hard disk. What have Atari done with this STe?

BTW, our hard disk cable is 9 inches long - I think this is short enough.

433. File Transfer Blues... Help!

Newsgroup: comp.sys.atari.st
Date: 1990-06-25 01:30:06 UTC
From: ladasky@codon1
Message-ID: <1990Jun25.013006.1223@agate.berkeley.edu>
Source record: 240051

O.K., so I'm hooked up to my Unix account using Uniterm V. 1.7 and everything seems to br working fine. Terminal emulation is cool, and I can send text back and forth using Kermit without any difficulties. Then I get the bright idea of sending a MIDI file up to my account, so I want to use the binary transfer mode. Sounds easy enough, but the two machines decided that they don't feel like speaking 8-bit lingo to each other, despite the fact that both Kermits have been set to file type binary, and that the parities, packet sizes, etc. all match (as should be obvious from the fact that I could transfer the text stuff). I was able to monitor the transfer from the Uniterm window - the first packet seemed to come across, but the second packet generated a "Bad Chk" error, which was repeated until 10 re-tries occurred and the transfer aborted.

So then I tried XMODEM. I was again able to monitor the transfer from my Atari. This time, I received "No ACK" error messages from the very first packet, which of course continued until I shut the thing up. By this time, I was out of ideas. So - anyone out there in net.land have any clues? Also, the Uniterm manual refers repeatedly to "the Kermit documentation" which is presumably available elsewhere. Does anyone know where I can find it?

I have one suspicion which I would greatly appreciate having ad-dressed - if only for my peace of mind. The dialup for the campus computer requires that I configure my modem for 7 data bits, not eight. What does Kermit do, if anything, when it is transmitting 8-bit data over a 7-bit connection?

Please send me mail, as I can't see myself wading through the whole newsgroup on the rare occasions that I actually read it - and I wouldn't want to miss any advice. Thanks in advance.

Hi,

I am using SIM city here in France. It is quite a good game and I spent almost full nights on it.

I would only regret that the MAP window is not sizeable and , of course the worst is that horrible BUG in GEM that make ou have to repeat mouse clicks on sliders to make them move multiple times. Its a shame when you have to deal with big towns...

And why could not we get the PRINT-CITY feature unlike PC or Mac versions ?

Alex.

->Different compilers give different Dhrystone ratings depending on how
->agressive their optimization is. Dhrystone does some very strange
->things, including copying constant strings into word-aligned buffers.
->Compilers can "cheat" on this by turning strcpy() into a simple loop.

True.

->As a result, you can get results as high as 1500 on a standard ST.

You can get about 1700 on a standard ST using Turbo C, and you will get
about 800 using Alcyon, but there`s no "cheating" in this: the difference
results from TC using dynamic register allocation and register argument
passing (and genereally better code).
But in reality the speed advantage of TC over Alcyon isn't that big,
from my experience you can expect a 40-60% speed improvement, depending
on how good the (static) register declarations already are.

With ancient versions of Uniterm, Uniterm would set itself, on startup,
to whatever colour palette had been in use when you last saved the
setup file. Don't know if this is still true, but worth a try.

To check it, boot up with the control panel in place, and then run
Uniterm. Hit 'help' to get to the help window, open the control panel
DA, and set up whatever colours you want. Then close the control
panel, and do a Uniterm 'Save Setup'. Might work...

I'm a relative newcomer to GEM programming using C and am somewhat
at a disadvantage as I have hardly any documentation at the moment (that's
been sorted out though). I'm trying to write a program in Megamax C (soon to
become Lattice C v5.0) which will run as a standard ST program and as a desk
accessory if renamed to .ACC I've managed to do this by using the standard
Atari ACSKEL.C accessory skeleton and adding the necessary code for a PRG.
The program tests whether it is an ACC or a PRG by examining gl_apid, the
application id. Is it right to always assume that 0 indicates a PRG and 2
(or at least >0) is a desk accessory ? This is the way I do it annd it works
quite happily.
The idea is to write a mini-editor in a window which run
accessory normally but can be double-clicked if not installed initially.

Thanks in advance,
Steve Sowerby.

442. misc.forsale.computers passes vote

Newsgroup: comp.sys.atari.st
Date: 1990-06-25 16:23:58 UTC
From: t-rayc@microsoft.UUCP
Message-ID: <55426@microsoft.UUCP>
Source record: 240061
Cross-posted to: comp.sys.ibm.pc,comp.sys.apple2,comp.sys.amiga,comp.sys.atari.st

(For those who do not follow news.announce.newgroups.)

The newsgroup misc.forsale.computers has passed its vote, and news
sites are gradually adding it to their arsenal. The group was created
to provide a safe resting place for computer-related "for sale" articles.
Please refrain from posting such articles to comp.* groups in the future.
Thank you.

One-line description:

misc.forsale.computers
Short, tasteful postings about computer items for sale.

Charter:

Misc.forsale.computers is devoted to short, tasteful postings about
computer items for sale. All standard guidelines for "for sale" items
apply. No discussions, please. This charter and the following
guidelines will be posted periodically.

General guidelines:

[1] No crossposting into comp.anything.

[2] Restrict distribution as much as possible. Restricting to the
country is almost certainly a must, since customs are often a major
problem. Restricting to the state or other local geographical
region is probably a good idea if the object is large and shipping
would be a concern.

[3] Include your telephone number (and possibly postal address) so that
people who can't negotiate email paths can still contact you.

[4] Do not post "I've sold it" messages. If you have sold it, cancel
the original message. If you don't know how to cancel a message,
ask your local news administrator.

[5] Make the subject line as clear as possible. If your item is meaningful
only for a particular machine, put that machine's name in the title.
That way people can set up KILL file entries to weed out articles
that they don't care about. If you'd like to set up a KILL file,
ask your local news administrator to teach you how to do it.

443. Re: STe "Fiasco"

Newsgroup: comp.sys.atari.st
Date: 1990-06-25 16:32:05 UTC
From: grahamt@syma.sussex.ac.uk
Message-ID: <2953@syma.sussex.ac.uk>
Source record: 240071

From article <1990Jun22.104705.5295@hayes.fai.alaska.edu>, by fsdmb3@acad3.fai.alaska.edu:
> 2) I Have read in March ST Format, a leading British Mag. that the STe (which
> was released at Christmas time) Doesn't run a lot of heavily copy
> protected games. 30 are listed in the Mag, including Populous,
> Speedball, and Captain Blood. But it also won't run STOS or 1st Word!
>
ST Format exaggerated the number of programs which were STe
incompatible. I can't speak for the games, but I have had no problems
running First Word Plus (v3.14 and now 3.15, UK) on my STe.

> They also released a patch for the medium resolution booting problem.
> Since Christmas STOS has been said to have been fixed to work with the STE.
>
The bad news is that STe's in the UK are still being distributed with
the medium resolution booting problem, so people still have to find the
patch from dealers, BBS, etc. The good news is that, yes, STOS has been
fixed.

Given the choice, I'd go for the STe every time, if only for the easy
memory upgrades.

I've seen the same thing when using OS-9's PC File Manager to write PC-compatible disks - when looked at on the ST the directory looks fine, but the same sector or few sectors are repeated throughout the file. I can copy the file to a real PC, delete the file, and re-copy back to the disk and then my ST can read it. Any ideas what might produce this behavior?

I too love it! Only thing it doesn't do versus PC version is print the city.
It should be possible (though I don't know how practical) to write a utility
that prints the city directly from the city save file.

The game is fully GEM, user interface is quite good. Maxis has promised all
future software (SimEarth, among others) will be ported to the ST also.

451. DLII

Newsgroup: comp.sys.atari.st
Date: 1990-06-25 20:38:00 UTC
From: bill@mwca.UUCP
Message-ID: <1645@mwca.UUCP>
Source record: 240072

Twice I've seen bizarre and dangerous behavior when using DLII to undelete a file - all seems well, but when I return to GEM I have _two_ of the file I just undeleted, and attempts to fix things (by copying, deleting, renaming) seem to end up trash most of the directory those files are in. I've seen this happen twice, it may be that in both cases I had two or more of the filename which had been deleted (that is, there may have been two deleted files called _tarist.msg, and maybe DLII tried to undelete them both). At any rate, be careful before undeleting!

Also, possibly related, I've seen TOS 1.4 open a window, I'd execute a program, then when returned to the desktop the window is invisible - GEM still thinks a window is open, and if I open another window it goes where my second window customarily goes, but clicking anywhere where the 'invisible' window should be has no effect. Has anyone else seen this/have an explanation?

Bill Sheppard

452. Unix on the Atari ST

Newsgroup: comp.sys.atari.st
Date: 1990-06-25 20:42:28 UTC
From: RXS12@psuvm.psu.edu
Message-ID: <90176.164228RXS12@psuvm.psu.edu>
Source record: 240076

I found myself swearing too much at TOS the other day and decided to dedicate the next 10-20 years ;-) writing a complete Unix for the ST, not to really run under TOS but to replace it. (eventually)

What I need to know is this:

1) Has someone else done this? (No, I am not asking for gulam responses. it is nice but I wan't *true* Unix.)
2) I don't praticularry feel like having to write the kernel ... does anyone know of any multi-tasking kernels that have been written for the ST? Related to this I am going to need a swapper ... same question.
3) I will also need a C compiler that is powerful enough to understand everything that I will need to use. Any suggestions?

I want to eventually have this:

True Unix which is modeled after 4.3 BSD and (If I get some support...) Mach with some "enhancements" to what is the currnet standards for csh.

I am going to also eliminate the \ in filenames and make the a:, b:, c: drives mountable to a home (/) directory. I want to eventually have all of BSD ported ... including all of the networking stuff.

I know the amount of work that will be needed to put something of this scale into reality. I am just tired of TOS and love Unix.

Hope someone can help,

Rongshyang Sheu

P.S. I am also looking for the source of csh that is with 4.3 BSD Unix if anyone knows where i can get it please let me know.

453. AT emulators - now available

Newsgroup: comp.sys.atari.st
Date: 1990-06-25 21:00:18 UTC
From: chris@ethz.UUCP
Message-ID: <4890@ethz.UUCP>
Source record: 240067

Following up to some requests of clarification here are the
specifications of ATonce, the build-in AT-emulator for ST and Megas
available for about DM 500.- at:

Vortex Computersysteme

Falterstrasse 51-53

D-7101 Flein bei Heilbronn

+49 - 71 31 - 50 88 - 0

+49 - 71 31 - 5 50 63 (Fax)

These specifications are as provided in a leaflet from the producer.
I think ATonce is already on sale here. As a consequence to this coup
de surprise the manufacturer of PCSpeed has already announced an
AT-Version called ATspeed, but yet without any specifications.
Competition works ... BTW I have absolutely no relations to any of
the above mentioned.

- 80286 Processor with 8 MHz

- Norton-Factor 6.3

- 704 KByte DOS-Memory

- supports CGA and Herkules as well as an EGA- & Olivetti-mode

- uses the Atari-Mouse as MS-Mouse

- support of harddisk/winchester

- 3.5/5.25 floppies with either 360K or 720K

- Interfaces: LPT1 (Centronics) and COM2 (RS232)

- sound support

- SMT technology

Uh huh. It'll be both a hardware and a software project, y'know...

>What I need to know is this:

> 1) Has someone else done this? (No, I am not asking for gulam responses.
> it is nice but I wan't *true* Unix.)

You might consider starting with Minix. Just an idea. It's only V7, not
full BSD, and it would still be a lot of work getting it to resemble BSD,
but shouldn't be as bad as starting from scratch.

> 2) I don't praticularry feel like having to write the kernel ... does
> anyone know of any multi-tasking kernels that have been written for
> the ST? Related to this I am going to need a swapper ... same question.

You can also look at MicroRTX, which keeps TOS compatibility, or OS-9, which
is supposedly source-code compatible with Unix. (I don't know which variety of
Unix...) You will also need a memory management unit to allow for a swapper,
yes? Or I suppose you could just swap into fixed regions of memory...

> 3) I will also need a C compiler that is powerful enough to understand
> everything that I will need to use. Any suggestions?

It seems that most operating systems still require some fine-tuned hand coded
assembler. I don't think you'd want an OS written in 100% C, and most of the
available compilers are good enough to take care of the 80-90% that it makes
sense to use 'em on. But if you're already aimed at BSD/Mach, check out gcc.

>I want to eventually have this:

> True Unix which is modeled after 4.3 BSD and (If I get some support...)
> Mach with some "enhancements" to what is the currnet standards for
> csh.

Like tcsh or ksh? But they're just shell programs, they're not part of the
operating system... You know, getting the BSD 2.10 sources might make a bit
more sense. A 68000 is a lot closer to a PDP-11 than it is to a Vax-11...

> I am going to also eliminate the \ in filenames and make the a:, b:, c:
> drives mountable to a home (/) directory. I want to eventually have all
> of BSD ported ... including all of the networking stuff.

The BSD 2.10 is pretty much 4.3 crammed into a PDP, with all the networking stuff too.

>I know the amount of work that will be needed to put something of this scale
>into reality. I am just tired of TOS and love Unix.

Yeh. I'm sick of silly backslash path separators. Although at least in TOS we have Fcreate, instead of creat. }-)

> Hope someone can help,

> Rongshyang Sheu

Good luck... 10-20 years is too long to spend on a project in the computer field, y'know.

459. SUNCLOCK2, a review

Newsgroup: comp.sys.atari.st
Date: 1990-06-26 03:08:32 UTC
From: ljdickey@water.waterloo.edu
Message-ID: <1990Jun26.030832.23465@water.waterloo.edu>
Source record: 240080

SUNCLOCK, Version 2, a program for the Atari ST, adapted by J.E.Th. Mathijssen (joep@izf.tno.nl), based on a program written for the Sun computer by John Walker ({sun,well,uunet}!acad!kelvin). Monochrome.

SUNCLOCK, Version 2, is a program that produces a map of the earth that illustrates that portion that is lit up by the Sun at the current time. About half of the map is white with black outline of major geographical and half is black, with white outline.

The first time I ran SUNCLOCK.PRG, Version 2, it was early in the morning, just before dawn, and the map on my screen showed my part of the world as though it were still shrouded in darkness, and nowhere near the terminator, that the edge between night and day.

I soon figured out that the reason for this is that my location in Waterloo is in the Eastern time zone, and the program has a default setting for the Middle European Time Zone, and at when it is five in the morning in Europe, it is the middle of the night in North America and most of the "New World" is in darkness.

By clicking with the mouse, I found that I had the option of setting an offset to adjust for the time zone I am in. I set the offset (the correction factor) to be "-300" minutes since Waterloo is in the Eastern time zone, 5 hours earlier than GMT. Also, since we are on Daylight Savings Time here, I clicked on the box that said "Savings Time". It was now about 5:30 AM here, close to sunrise, and I watched the sunrise outside my window while I watched the screen as the terminator shown on the SUNCLOCK crossed the point on the map where I imagined Waterloo to be.

It was great. Later, after I turned off the program by double clicking with the left mouse button, I got a little message on the screen that informed me that my time zone adjustments were being saved. This meant that I would not have to reset the offset each time I ran the program. Indeed, when I restarted the program, the offset was the same as I had set it, and I did not have to set it again.

When you run this program, you will notice that the offset can be set to the minute. You may be wondering why this degree of accuracy is needed. Part of the answer is that an accuracy to the nearest hour is not enough, because of places like some parts of Canada, Australia, India, and Pakistan that need a finer correction. For instance, folks in Newfoundland, a part of eastern Canada, run their clocks one hour and thirty minutes ahead of clocks in the eastern time zone. There may be some places in the world that have stranger offsets. I seem to remember reading about places with an offset of so many hours and

something like 14 or 17 minutes, but a glance at a recent almanac failed to reveal such a place.

There are some other nice options for SUNCLOCK. One can "animate" the display and get the program to move forward or backward in time, by jumps of an hour or day or week, and so on. It is fun to watch what happens, week by week as the tilt of the earth is demonstrated by the fact that the northern hemisphere gets more light in the summer and the southern hemisphere gets more light in the winter.

I like the fact that the offset is based on GMT, because I know that Eastern Standard Time is five hours away from GMT, and I suppose that most folks in the world can figure out what their offset is, relative to GMT. For me, it was fun to play with this offset and imagine how people in different parts of the earth would be experiencing sunrise today.

Joep Mathijssen, who designed the interface to this program in the summer of 1990, lives in the Middle European Time Zone, so I imagine that he sets the system clock on his Atari ST to agree with local time, and sets his offset to be +060. I suppose that in the fall, when Daylight Savings Time ends, he will reset the clock on his system, keep the offset the same, but will de-select the Daylight Savings Time feature.

Those of you with a big screen may be able to make use of that extra area that you have, because this version is supposed to be able to make use of that. I was not able to try out this feature.

Finally, let me say that I like the program. It is educational, entertaining, and it is useful, because it tells the time, and I can guess something about the time in other parts of the world.

460. Re: Pictures on the ST

Newsgroup: comp.sys.atari.st
Date: 1990-06-26 03:30:55 UTC
From: jms@tardis.Tymnet.COM
Message-ID: <1140@tardis.Tymnet.COM>
Source record: 240084

In article <2701@mrsvr.UUCP> krieg@jupiter.UUCP (Andrew Krieg) writes:
>I recently saw some IFF pictures on my friend's Amiga and was greatly
>impressed. They made most of the Spectrum pictures I've seen look like water
>colors. Is there a better graphics format than Spectrum for the ST? Does
>the Amiga 2000 have a higher resolution than the 520 ST? Is this a result of
>IFF displaying more colors or something?

Atari ST resolutions:
320x200, 16 colors out of 512, regular color monitor.
640x200, 4 colors out of 512, regular color monitor.
640x400, 2 colors, black and white (31Khz) monitor.

Amiga resolutions:
320x200, 2, 4, 8, 16, or 32 colors out of 4096.
320x200, 64 colors out of 4096. (limitation on 2nd set of 32 colors)
320x200, 4096 out of 4096. (some limitation on adjacent colors)
640x200, 2, 4, 8, or 16 colors out of 4096.
Plus an additional set of 11 resolutions with 400 lines (interlaced) instead
of 200 lines. (The screen may flicker in interlace mode, but it matches the
NTSC standard RS-170, allowing easy interface to genlocks and VCRs.)

Amiga programs switch between any of the 22 resolutions to any other, without
rebooting, all on the same monitor. (Or have the top half of the screen in
one resolution and the bottom half in another.)

An upgrade to the Amiga provides new resolutions:
1280x200, 4 colors out of 64 for 35 nanosecond pixels for NTSC (15Khz)
1280x400, 4 colors out of 64 for 35 nanosecond pixels for NTSC (15Khz)
640x480, 4 colors out of 64 for VGA (31Khz) compatible monitors
640x960, 4 colors out of 64, interlaced at 31Khz

Sorry, I don't know for sure the resolutions on the TT.
Does the TT support 640x400 resolution on a color monitor?

Ah! To think that I was so young and innocent once!

Good luck with your quest, but I somehow doubt whether anyone from Atari
will have any interest in revealing accurate figures. Worse, it's
entirely possible that nobody will even know them.

Cheers,

Graham

THANKS Paul ...

I had been trying that because I thought that was how I did it before.
Nothing would work. I needed a kick in the butt to get me to use my head
and your message did it.

You see, I had been calling Uniterm from NeoDesk.

It apparently holds the screen colors in a different place than the
original desktop.

Anyway, the trick is to use the original desk accessory to set the colors
instead of the NeoDesk one.

Once I did this everything saved out just fine. Now I can be perfectly
happy again ... weeeellllllll..... maybe not perfectly ...

The one thing I wish it DID have was, I hate having to use the slider
bars to move around in the city. Why can't it be more like the PC
program in that respect?

I have experienced this problem you mention too. The Window seems to
open underneath a disk drive icon, and it appears to have 'zero mass',
so to speak...if you look close you can see the special effects from
the window opening, but you can't see the window...Is this a TOS 1.4 bug?

>under TOS but to replace it. (eventually)

Why not take a look at os9/68000 from microware or MINIX from Prentice Hall.

>What I need to know is this:

> 1) Has someone else done this? (No, I am not asking for gulam responses.
> it is nice but I wan't *true* Unix.)
> 2) I don't praticularry feel like having to write the kernel ... does
> anyone know of any multi-tasking kernels that have been written for
> the ST? Related to this I am going to need a swapper ... same question.

Yes, this is what MINIX does. This operating system is supposed to be fully UNIX 5 compatible. this is not the optimal solution as far as performance goes on a 68000 system like the ATARI, as the lack of an MMU causes problems every time you fork a child process. This is not a problem on the IBM-PC where segment registers perform the function of an MMU. Only real addresses can be issued by MINIX, and these must be in store (what lusers call memory). If your problem is that you are always running out of memory, and you would like to swap to disk, then you will have to do some modifications here! Minix tries to perform a true fork, using disk IO to roll in/out children when they are identical processess (rare), or re-assining a new address space to a child when it is different to its parent. This is wastefull, but simple to implement...

(if you don't Know what fork(2) is, read the UNIX man page!)

OS9 allows shared code, so forking multiple copies of a program means only allocating new stack/data for each new copy. This operating system still issues real addresses to real store - forget any ideas of writing a swapper. OS9 has a more rubust file system, in that no cacheing takes place. Many a unix/minix system has lost a file store when some external event (eg idiot turns hits big redd switch/ storm cuts cable) has killed the power supply before the cpu could write the directory structure to disk...

> 3) I will also need a C compiler that is powerful enough to understand
> everything that I will need to use. Any suggestions?

The minix C ompiler has many weaknesses (the local MINIX hacker is currently telling me the bad news:-) if you do lots of bit twidling or floating point, then this is not good enough... The OS9 system has all the bit twiddling you could ever want, and implements floating point using A$ and F$ traps, so that a 68881 could be added and used automaticaly by all programs that need floating point...

>I want to eventually have this:

> True Unix which is modeled after 4.3 BSD and (If I get some support...)
> Mach with some "enhancements" to what is the currnet standards for
> csh.

> I am going to also eliminate the \ in filenames and make the a:, b:, c:
> drives mountable to a home (/) directory. I want to eventually have all
> of BSD ported ... including all of the networking stuff.

A:, B:, C: etc are features from CP/M (which was an operating system) which
were taken over by DOS and TOS (which are NOT operating systems!) To retain
this is silly. 360K floppies are accessed as /dev/fd0... 1.2M as /dev/at0...
etc. OS9 has a similar solution. / is ROOT and not $HOME! For networking under
minix NFS requires you to port RPC,or you an use amoeba . Under OS9 there
is a means of networking that is comparable to SunOs 4.1 in terms of what
it can do. (if this is gobbledygook then you should start reading some manuals!)

>P.S. I am also looking for the source of csh that is with 4.3 BSD Unix if
> anyone knows where i can get it please let me know.

This is copyright material - even if I had it, i couldn't give it to you!

I am not trying to write a flame - I just want to answer the questions as best
as I can and inform as many TOSsers and DOSsers about the error of their ways
as I can! I use unix and OS9 at work, and am currently throwing out DOS
for MINIX on a PC and hope to aquire some OS9 systems for home.

If anyone wants more info, mail me

You might want to consider buying OS-9. It is a real-time OS that takes over
the complete machine (a real OS). It is true multi-tasking and multi-user.
Most UNIX source code will port to OS-9 with minor changes. There is also a
package from Germany that includes MANY UNIX utilities and games.

Ric Yeates

PS I am aware I work for Microware and we make OS-9, but I am only offering the
information as an alternative to writing UNIX. If you want more information,
I will be happy to EMail it.

>(PD Library, or I'll send you a disk...)? Thanks in advance!

I have a copy. It was given to me by a friend visiting from Norway.
Apparently, it is HEAVILY copy protected. It will only copy itself
from a built-in copier that is part of the demo. Therefore, it is
very difficult to "crack" and send around via modem. If you send
me a diskette, I'd be happy to send you a copy. It is quite
spectacular. Those guys should program professionally. The demo is
better than many commercial products I have seen.

> ... there are Amiga programs that do similar tricks as Spectrum
>does on the ST, giving you all 4096 colors at once.

Yes, there are. But you can get 4096 colors at once using the Amiga HAM mode (in 320x400 resolution) without the program doing any tricks or the processor having to do any extra work. This mode essentially compresses 4096 colors (12 bits) down to 6 bits by encoding a pixel color as either one of 16 absolute entries (selectable as first 16 entries in the color palette) or as the previous pixel color plus a replacement of one color component (R, G, B). Photographs of people and scenery and most ray traced pictures end up looking great in this mode; some pictures suffer from fringing effects, though.

It's of course true that there are programs that resort to changing the color palette on the fly to give you modes such as 4096 colors at once in hi-res.

473. Club Libraries.

Newsgroup: comp.sys.atari.st
Date: 1990-06-26 14:53:21 UTC
From: ljdickey@water.waterloo.edu
Message-ID: <1990Jun26.145321.9843@water.waterloo.edu>
Source record: 240099

Our local librarian is looking for good stuff to use to
organize the our club PD and Shareware collection.

(1) What software do you (or your club librarian) use
to keep your library in order?

(2) Does your club make this software and data base available
to club members, or do you just circulate a list of stuff?

(3) Do you have a way of distributing reviews, comments, or hints
about the software?

(4) Some (book) libraries use a card catalog system.
Does anybody have software that approaches or improves on this?

(5) We think we would like to have the ability to organize
things in some systematic way. Do you (or your club)
have a good way of classifying programs?

Any comments would be appreciated.

From: swood@vela.acs.oakland.edu
Message-ID: <1850@vela.acs.oakland.edu>
Source record: 240088

I have been trying to get Uniterm to run a zmodem program without much luck.
I thought that that was what the Run Program option was for. It gives me
a tos error #39. Unfortunately I am new to TOS and the ST. The program
will run fine if I leave Uniterm all together, but it logs me out when I
jump back into Uniterm (does anyone know how to stop this either?)
Any help would be appreciated, as the kermit at school is much too slow,
and even though the xmodem works, I have been having some trouble with
it clipping the ends of files.

> 1280x400, 4 colors out of 64 for 35 nanosecond pixels for NTSC (15Khz)
> 640x480, 4 colors out of 64 for VGA (31Khz) compatible monitors
> 640x960, 4 colors out of 64, interlaced at 31Khz

The Amiga 3000 and any Amiga with the Enhanced Chip Set may also switch
without rebooting between NTSC and PAL compatible modes. In PAL mode,
the vertical height is 256 (non-interlaced) or 512 (interlaced). The Amiga
3000 also contains circuitry to de-interlace the 400 or 512 line modes
that are 320 or 640 pixels across, and output VGA compatible signals.
De-interlacing products are also available for the Amiga 2000.
That is, you may run in 640 x 400 VGA (flicker-free) with 16/4096 colors.

The A2024 monitor gives 1008 x 800 (1008 x 1024 in PAL) in 2 or 4 shades
of gray, for any Amiga. The Viking Moniterm 1 gives the same resolution
for any Amiga with a video slot.

In addition, the Amiga offers support in the OS for overscan. It is also possible to do "dynamic hi-res" or "dynamic HAM", which I gather is akin to the 512-color ST pictures (same kinds of tricks).

The Amiga also has programmable video modes, so things like 24 frames per second are possible without hardware modifications.

All 68000 traps are format 0. The 68030 can produce formats 0, 1, 2, 9,
A, and B. Line A traps are format 0, so system traps using the line A
exception are not a problem.

Message-ID: <48895@iuvax.cs.indiana.edu>
Source record: 240095

If any one knows the real address for the people handling Ultima III, could they please send it to me. (The address on the rules, 340 Harvey Road, does not work.) Since I recieved no reply to my last such request, I presume that there is no longer a real address. That being the case, can someone in Indiana or Georgia let me make a copy of their game. I am the owner of a legal copy of the game bought from an outfit going out of the Atari business. When my copy did not work, they let me try their other copy, but it did not work either. (Both copies looked like they were returns.) The store would let me trade this in on any of their remaining atari games, but I already bought all the ones I want, and I would really like to play Ultima III. Can anyone help?

"Color blindness" doesn't mean the person can't see red things--
in this case, red-green color blindness just means they won't be
able to tell "red" and "green" apart. Red print on reddish paper
(like the SimCity sheet) should be just as readable to them as to
anyone else... red print on GREEN paper would cause problems for
someone with red-green color blindness, like the color blindness
tests that have numbers made of red and green dots.

Of course, red print on green paper would give everyone else
a headache when they tried to read it, too. :-)

Hmmm... Seems to be a lot of "propagandizing" on the ol' net lately.
Seems like a Commodore engineer would have better things to do than
read c.s.a.st. ;-)
Now, don't start on me. This is not another shot in the Everlasting
Holy War between Atari-types and Commodore-types. I did my time in the
trenches, but now I have other concerns than "whose floppy is bigger".
The only reason I've brought it up is that all the talk about the merits of
the Amiga 3000 would seem to be better placed somewhere else. Yes, it's
a neat machine, and dirt cheap besides; but, if a potential TT-er wants to
learn more about the A3000, let him read comp.sys.amiga (or Byte magazine).
On the other hand, there seems to be little else to do in c.s.a.st besides
random flaming, so maybe a little advertising would put the bandwidth to
better use. You could even cross-post to misc.foresale.computers.
Just one guy's opinion...

>TRAPs are going to break on the TT unless they take this into account.

The 030 has more registers than a 000. So it will save more on the stack
when hit by an exception.
It's the same with 010 and 020 MPUs: for example the 010 saves her
workspacepointer (register indicating the starting adress of the
exception vectors) and the state of the decoding pipeline on the stack
when hit by a BUSERR or the like.

So any program that tries to pop something of the stack by ADDing to the
stackpointer, will probably break, cause the 010,020 and 030 put more on
the stack than the program exspected.

Hi! (Zaphod Beeblebrox)

484. Using joystick and mouse

Newsgroup: comp.sys.atari.st
Date: 1990-06-27 08:34:27 UTC
From: fk@vall.dsv.su.se
Message-ID: <847@vall.dsv.su.se>
Source record: 239904

Could someone be kind enough to supply me some pointers to the canonical
way of getting access to the mouse and joystick information. I know there
is a VDI call which returns the mouse position and button state but
I'd rather grab the info first hand.

The current set of ideas that I entertain involve the following steps:

a) Save the vectors to the installed mouse and joystick
packet handlers.
b) Save the current state of the keyboard processor
and tell it to stop reporting events
c) Install vectors to my own mouse and joystick packet handler
d) Tell the keyboard to start reporting again, including any
application specific properties of mouse and joystick

e) Process input until its time to shut down.

f) Stop the keyboard processor
g) Reinstall the original keyboard packet handler vectors
h) Restore the previous state of the keyboard processor
and tell it to start reporting events

The above procedure is my general outline of how to do it. If you know
any simpler method, please tell me. Also, I'm interested in the properties
and constraints put upon a packet handler. I seem to remember that one
must return within 1 ms, but how are the arguments organized? Does TOS
prepare the data from the keyboard processor in any way before handling
them to the packet handler?

I don't want to read mouse coordinates out of some TOS-version
specific protected memory location. What I want is to process the
messages as soon as they arrive. In particular I hope to estimate
joystick motion velocities by measuring the interval between
close/open packets. Any references to such techniques would be highly
appreciated. I am using Sozobon C, writing in C and assembler, on a
1040 STFM, TOS 1.0.

Visibly Show File now treats the left and right mouse buttons as equivalents
to pressing SPACE and Q respectivly. There are some new system variables too
that help application writers but I can't go in to too much detail about them
as I'm a developer under oath (are you listening Matthew Lodge? :-)
Other new things are connected with the STE's (and probably the TT's) new
hardware (eg. 4096 colours, BLiTTER, extra joysticks and analogue input)

>writing a good game. You have probably never heard of their games,
>though they are technically spoken excellent. It's more to a good game
>than that.

It's also important to keep in mind that a demo can essentially devote
all of the machine's time and memory to its one task, while a game
requires memory and time for "mundane" tasks like keeping track of
player stats, collision checking, etc.

For example, a clever demo might employ 12 screens to accomplish
extremely smooth scrolling, but the same technique would likely be
unworkable in a game since it would require devoting 384K just to
screen RAM.

A similar case is Spectrum 512. Sure, a demo can have static screen
images with more colors than normal, but writing a game using the
Spectrum "screen mode" would be ludicrously difficult. (Now that I've
said that, who wants to go out and try?)

> (Don't you like NetHack? I do, though it has quite poor
>graphics... ;-)

Yes, NetHack is truly a great game. I've probably spent more hours
playing NetHack than any other ST game. (The latest port is great!)

Others have reported this too. Eric R. Smith, (ersmith@uwovax.uwo.ca),
has pointed out that a simple C program may be aliased to mem, so that
the command "mem" does not access the Gulam function, but invokes the
C program that tells you the largest chunk of memory you have available
for use.

This is to rodney@merkur....

I have been trying to send you mail to get some info on your uucp modules.

In particular, can they be used on any st? Is it Shareware/Freeware, or a commercial product, and if commercial how much is it?

Please respond asap. If you can send me mail, please do.. It will probably be a little faster..

Thanx...

John

<Names and uninteresting stuff deleted>

The Union Demo REALLY IS a nice graphics and sound "experience."
But I doubt that the programmers had any intention of copy protecting it.
Why would they have put a built-in copier!?!?! It seems that they just
wanted to get as-much-as-they-could on the demo disk, and a side effect was
that it wasn't TOS file compatible...

By the way, on my STe, most of the software overscan stuff in the demo make
those portions of the screen go haywire... (You should see what the full-
screen part of it looks like on my machine!!!)

This isn't a "nothing works on the STe" message either!

Thanks! I'm glad people are enjoying the game.

Incidentally, for people who missed the announcement on rec.games.hack a while ago, the binaries of NetHack 3.0.8 for the ST are available via anonymous FTP from terminator.cc.umich.edu, linc.cis.upenn.edu, and dsrgsun.ces.cwru.edu. (I'm not sure if the atari@terminator mail server is working yet, but if/when it is people will be able to retrieve them by mail from there). There are two files, nh308bin.zoo and nh308sup.zoo, containing the binaries and support files respectively.

Also, these binaries report themselves as being patchlevel 8, but they really should be called "patchlevel 8+", since a few minor post-patchlevel 8 bugs have been fixed. (There will likely be a "patchlevel 9" posted for the sources, which will incorporate these fixes).

The source code for NetHack is available from uunet.uu.net, and I think it will also be reposted in its entirety on comp.sources.games sometime in the near future.

NetHack is a real memory pig, unfortunately. It requires a 1 meg machine and a double-sided drive to play. Compiling the source code with the gcc takes 2 megabytes of memory (absolute bare minimum, believe me!) and a hard disk, and is recommended only for masochists :-).

505. Appletalk on the TT

Newsgroup: comp.sys.atari.st
Date: 1990-06-28 08:55:08 UTC
From: neil@cs.hw.ac.uk
Message-ID: <4951@brahma.cs.hw.ac.uk>
Source record: 239927

The TT has an Appletalk interface. IMHO this is a very smart decision by
Atari. Does Atari have any plans to make native TT software that will use
this on a network say like TOPS with Macs, PCs and Suns? I'm certain
Dave Small will use it when he converts Spectre to the TT.

On an unrelated topic:-
Is the CPM emulator for the ST in the public domain? If so, is there anyone
willing to mail it to me? Tell me first please. Thanks in advance.

>
>- Geoff Coupe

According to a 'review' (I call it that in the loosest possible sense)
of a TT in ST User in the UK, they mention that 1.44Mb drives would be
included as standard as soon as possible. There is a greyed out menu
option to format 1.44Mb disks on the desktop. But it looks as though
Atari will ship machines with old floppies for at least some time.

>
> Ali Ozer

Yes, Ali, HAM pics CAN suffer fringes, but if the raytracing programs better selected the palette, there would be VERY few cases of this. I find myself going through some of these raytraces with a paint program and finding that there are like 4 colors in the base palette that remain black. They COULD have used those, but NOoooooo, they're STUPID... BTW, the Amiga, theoretically can have 384 different colors per scanline (max. res. 384x480). And the special thing you were talking about there, was, for these ST people, 768x480 at 16 different colors per scanline. Not bad, but I *THOUGHT* they could have done better.

Some techniques used in demos are very usuable when programming games, though. For example -- imagine all ST games were using overscan and 4-channel sampled sound. This is not impossible, though the music does consume some cpu-time (around 12%, depending on it's maximum sample rate).

And games which have good graphics (ie large, eye-catching sprites) are easier to sell in a store. Kids tends to pick a colorful game rather than the dull and gloomy equivalent.

it's a shame if they can't tell us. 'Cause I'll bet that Nintendo knows
everything about the lynx (either through reverse engineering or more
likely they just bought a developers kit).

Oh well, maybe someday atari will get their act together. Problem is that
by then they will probably have alienated any loyal users left. :(

Just want to make something clear, so this won't be falsely advertised... The Magic Sac uses 64K ROMS, so that it only runs software that works on the older Macs. I would doubt if it will run "most" software now. However, you can use the old MacDraw, MacWrite 4.6, and other older programs, so it can be useful to a limited extent.

It is possible (just look at MINIX ST) but a 100 % UNIX cannot be ported to
the ST. There is a lack of a real MMU(Like the 68851(3)).

> 2) I don't praticularry feel like having to write the kernel ... does

516. reading joystick while hblanking

Newsgroup: comp.sys.atari.st
Date: 1990-06-29 03:58:44 UTC
From: cdixon@eagle.wesleyan.edu
Message-ID: <30476@eagle.wesleyan.edu>
Source record: 239933

Two questions:

1) Does anyone know a good way to read joystick movements while doing Hblank interrupts (in this case to get more colors on the screen). If you just replace the joystick vectors with your own without changing the Interrupt priorties you get flicker on the scan lines where the interrupt occurs. I tried disabling the joystick interrupt and poling the address to the joystick directly (I forget the exact address [0xfffc08 or something]) but it ends up reading garbage for the joystick movements. After tinkering around for a while I tried poling the joystick with an Hblank at about the 50th scan line and I get pretty consistent results-- but not perfect (or even acceptable). Does anyone know a better way?? (This is on a 1040st)

2) How can I get a copy of ST Nethack without using internet (I have no way to transfer files from the Vax [where I access internet] to my ST).

Thanks,
Chris Dixon

There is a CPM emulator in the PD. But you need a CPM Systems Disk too,
so please call your distributor or a PD Copy service to get one, because
I don`t know how to send the systems Disk via E-Mail.

>jhenders@van-bc.UUCP

Yes, the voting period ended June 7. I posted the results a couple weeks ago. I believe it was 183 Yes vs. 72 No. For a while the newsgroup was listed as "pending creation" but since then there has been a complaint filed with Eliot Lear that 183-72 represents only a 61% yes vote, meaning that the vote does not pass. Personally, I get 71% yes from those numbers. Interestingly enough, if you take 1 - 72/183 you get .606 ~ 61%, so I imagine this is how the bogus figure of 61% was derived; i.e., dividing by the number of yes votes instead of the total number of votes.

I'm sure it will get straightened out soon. (So please don't write nasty notes to Eliot; he's already been informed of the situation.)

Wrong! Atari has never completed or released a final TOS 1.4 on disk. If you are using a version on Disk, then it is either a developer version that is _way_ out of date or an authorized copy of TOS (which violates Atari's copyright and is illegal!)

Do yourself a favor, go to your dealer and have the ROMs installed. It's the best thing you can do for your ST.

Thanks to everyone who offered to send me the Union and other demoes! The response was great, mostly from Europe, although I'll only need to send to Seattle for it (I'm in N. California).

Perhaps it would be a good project for someone to hack the built-in program copier to allow the disk to be saved to a normal file, then recreate the disk elsewhere (for easier world-wide distribution!).

527. Questions on Mega4/HD/Laser setup (+ Dave & Bea)

Newsgroup: comp.sys.atari.st
Date: 1990-06-29 17:23:48 UTC
From: grahamt@syma.sussex.ac.uk
Message-ID: <3011@syma.sussex.ac.uk>
Source record: 239942

I have a couple of questions about strange behaviour on our two DTP setups. But first: I was looking through the ROM address space of TOS 1.4 and was delighted to find (at address $FD0294 AND $FD3206) that Dave Staugas still (after 2 ROM revisions) loves Bea Hablig. Not only that, but (at $FD124E) that Jim (Eisenstein?) loves Jeneane. Are there any more little messages lurking around that I've missed? There must be lots of room for this in the TT TOS!

Now the questions. We have 2 systems consisting of Mega 4, SH205 and SLM804 laser printer, which are used mainly for word processing & DTP work. Both exhibit (different) strange behaviour, and I'd be grateful for any info, clues, hunches, etc. about what's going on.

For a start, they use the DMA channel differently. System A (the older one, bought mid-87 I think) connects using the route Mega->Laser->Hard disk. System B (bought Spring 88) connects Mega->Hard disk->Laser. I think system A is the way the manual says it should be done, but neither system will work the other way round. (I've seen a magazine review where the reviewer - Richard Seel who used to do DTP reviews for the UK ST World mag - had the same problem and had to connect his system the 'wrong' way.)

System B sometimes has problems booting up - it boots from floppy unless we switch on the Mega first (after the printer of course), then switch on the hard disk, then do a warm reset. System B also sometimes comes up with 'Data may be damaged on drive D:' messages when we exit from First Word Plus (v3.14 UK). (Both hard drives are configured with Atari's software, the version released before HDX 3.01 - no, not 3.00, I know that was buggy. The version before that even. The 4 partitions C: - F: range from 2 to 10 mb.) As far as we know, the disk isn't really damaged. A reset 'cures' the problem.

System A has a different foible. Sometimes after exiting one program the machine won't run another (which could be the same prog again, or could be a different one). After double-clicking on prog no.2, the prog is highlighted, the mouse pointer changes to the busy bee, then nothing else happens. Generally, this takes a cold boot to clear. A warm boot doesn't do it (and a warm boot with the machine in this condition bypasses George Woodside's virus guard bootsector on my bootup floppy).

Both these systems get used by several people, so there could be odd things lurking around on the disk. But I've run checks with DLII and cleared out whatever lost clusters and zero-length files were there. I don't have any really exotic auto progs & accessories in there, just things like foldr100, pinhead (1.4 currently), G+Plus, Little Green Selector. Both machines are running TOS 1.2.

Thanks for staying with this rambling monologue. Does anyone have any suggestions? I'd be happy to answer any questions you think might be relevant. These problems are not fatal, but they're annoying, and anything to alleviate them would be very welcome.

Graham

Oh? And what are your qualifications to perform software testing
on TOS? Do you have a copy of every application program and every
piece of hardware that can be connected to an ST? Bob Brodie talks
to Atari Software Engineering every day, and they're more qualified
to know what is in TOS than you are.

From: ersmith@uwovax.uwo.ca
Message-ID: <6349.268b6c8f@uwovax.uwo.ca>
Source record: 240001

There is a bug in the NetHack 3.0pl8 binaries. The code for checking
for the presence of a monochrome monitor doesn't work, and in fact
produces a bus error. The workaround is to set the "nocolor" flag
explicitly in the "nethack.cnf" file if you're running NetHack on
a monochrome monitor. I'll be sending out pl9 binaries this weekend
that will have this bug fixed.

Yet there are surely limitations here too. I assume this "4-channel sound" is accomplished with digital mixing; i.e., take the four samples to be played and average them to get a new sample value. One limitation is that the sounds all have to be sampled at the same rate, otherwise the mixing becomes much more difficult. (Having not seen the demos, I admit they may be doing something else to get the 4/6 channels.)

In any case, playing digital sounds at higher sample rates than 4KHz will noticeably slow down game play. This limits the sound quality and makes playing sampled music during a game much less workable than you might expect. I don't know of any action games that play sampled music while you play (sampled sounds yes, but not music). Anyone seen an example?

From: marauder@nadia.stgt.sub.org
Message-ID: <1256@nadia.stgt.sub.org>
Source record: 239944

I had the same problem on my first try. On the second try (luckily the shop had two Ultima V), I found out that this problem is home-made. It occurs when you insert a write-protected player disk and remove the write-protect after you're told that you inserted the wrong disk. On the next write to this disk, the program thrashes the disk and you get 'offset map' when you try to leave Iolo's hut. If you were playing from a backup, no problem.

Source record: 240008

pwp@iuvax.cs.indiana.edu (Paul Purdom) writes:
>Does anyone know the format for the orbitals.dat file for the norad program
>that was posted recently?

Sorry for the delay in responding, our area has had a news slow-down.

Orbital Elements by Ted Molczan, 4 Feb 1990

There are 3 lines of data for each object. The first contains the name and
certain physical data. The second and third are the orbital elements, in the
standard NORAD "2-line" format.

Line 1

Line 1 contains the name, dimensions and estimated standard magnitude, in the
following format:

Column
01-15 Name
17-20 Length, m *
22-25 Width, m **
27-30 Depth, m ***
31-35 Standard magnitude (at 1000 km range, and 50 % illuminated)

* If width and depth are zero, then the object is a sphere, and the length
is its diameter. Objects with unknown dimensions have been assumed to be
spherical, and a value of diameter has been "guesstimated".

** If depth is zero, then the object is a cylinder, and width is its
diameter.

*** The standard magnitude is an estimate based on the mean cross-sectional
area derived from the dimensions. To estimate the magnitude at other
ranges and illuminations, use the following formula:

mag = stdmag - 15.8 + 2.51 * log10 (range * range / fracil)

where : stdmag = standard magnitude as defined above

range = distance from observer to satellite, km

fracil = fraction of satellite illuminated, [0 <= fracil <= 1]

Line 2

Column
01-01 Line number 1 of NORAD elements
03-07 NORAD number

08-08 Class
10-11 International designation - year of launch
12-14 International designation - number of launch since start of year
15-17 International designation - code for specific piece from this launch
19-20 Epoch - year
21-32 Epoch - day of the year and fraction, UTC
34-43 One half of first derivative of mean motion with respect to time,
rev/day**2
45-52 One sixth of second derivative of mean motion with respect to time,
rev/day**3 (leading decimal point assumed, not shown)
54-61 BSTAR drag term used by SGP4 (leading decimal point assumed, not shown)
63-63 Ephemeris type
65-68 Bulletin number
69-69 Modulo 10 checksum. Letters, blanks, periods = 0, minus sign = 1,
plus sign = 2.

Line 3

Column
01-01 Line number 2 of NORAD elements
03-07 NORAD number
09-16 Inclination, degrees
18-25 Right ascension of the ascending node, degrees
27-33 Eccentricity (leading decimal point assumed, not shown)
35-42 Argument of perigee, degrees
44-51 Mean anomaly, degrees
53-63 Mean motion, rev/day
64-68 Revolution number
69-69 Modulo 10 checksum. Same rules as for line2.

Header Lines

The elements are preceeded by a header line, and followed by a trailer line,
as shown below. These are included to provide start/end points to enable
programs to distinguish between the elements and any comments which may be
included.

startn2l

ALOUETTE 1 0.9 1.1 0.0 8.2
1 00424U 62B-A 1 90 25.21309753 .00000220 00000-0 25410-3 0 2561
2 00424 80.4628 67.0294 0022286 281.5113 78.3546 13.67284761363155

endn2l

Comments on Accuracy

Most of the elements in the N2L-XXX.ZIP files originate with NORAD, and are
distributed by NASA. I receive them from several sources, in hard-copy and
electronic form. These sources are usually accurate, however, they do not all

include all of the original NORAD data. For example, some sources omit the second time derivative of the mean motion, BSTAR, bulletin number and revolution number. Except for BSTAR, these are not serious ommisions. To ensure compatibilty with SGP4 users, missing BSTAR data has been estimated based on the mean motion, XN0 and the first time derivative of the mean motion, XNDT20, using the following formula :

BSTAR = XNDT20 / XN0 / C2 / 1.5

where : XN0 and XNDT20 have been converted to units of radians and minutes, as in SGP and SGP4

C2 = value computed during SGP4 initialization

Values of BSTAR obtained in this way are usually within about 3% of the original NORAD value.

The orbital decay terms produced by NORAD (and others) are often very inaccurate. In most cases, it is possible to make more accurate predictions by using average values. Most of the elements in the N2L-XXX.ZIP files have mean values for the first time derivative of the mean motion and BSTAR. The exceptions are satellites which make large manouevers or are greatly affected by solar radiation pressure, which can more than offset drag.

The average drag terms are obtained as follows. Using two elsets separated in epoch by about 7-10 days, the average value of the first time derivative of the mean motion is computed:

$$\text{average XNDT20} = \frac{\text{mean motion 2 - mean motion 1}}{2 \times (\text{epoch2 - epoch1})}$$

Then BSTAR is computed using the formula presented earlier.

For further information on the N2L-XXX.ZIP files, or on any other satellite observation related topic, leave a message for me on the Canadian Space Society's BBS, at 416-458-5907, 24 h/d, <=2400 B, 8N1.

539. NetHack 3.0 patchlevel 9 binaries available

Newsgroup: comp.sys.atari.st
Date: 1990-06-30 04:19:57 UTC
From: ersmith@uwovax.uwo.ca
Message-ID: <6353.268bf02e@uwovax.uwo.ca>
Source record: 240015

The binaries for NetHack 3.0.9 are now available on linc.cis.upenn.edu, in the directory pub/NH3.0/atari. If you have patchlevel 8 and are happy with it (i.e. it isn't crashing on you :-( ) then there's no particular need to get pl9. There are a few minor bugs fixed (in the handling of vault guards, for example) in addition to the big bug of not detecting monochrome monitors correctly (which was causing bus errors for some people).

I've also sent the binaries to terminator.cc.umich.edu, and they should be showing up there soon.

540. Re: SIM City

Newsgroup: comp.sys.atari.st
Date: 1990-06-30 05:42:50 UTC
From: Christopher@cup.portal.com
Message-ID: <31273@cup.portal.com>
Source record: 240010

There are some differences between the IBM, Mac, and Amiga versions an version. The ST version does not have the 'cheat' that allows you to embezzle funds (to the tune of $10,000 a pop). To do this on the other computer versions you just type in 'FUND' during the normal course of the game and it will give you $10,000. There is a catch, you cant do it more than a couple of times in a row, or you will suffer a major earthquake disaster.

I wondered that since the ST version of Simcity was programmed by Infrogrames (a french company (?)), that you might have to type in the french word for FUND. But I have no idea what that is. Anyone have any ideas as to what the cheat might be (if there is one).

Actually, it can be done. I have several demos, which play amiga music files
(soundtracker files for you amigaphyes) that play the music with 4 voices
at 28khz. The way they do it, is mix four 'virtual voices' into ONE physical
voice. This actually works VERY well, there is only a slight difference in
sound quality. I am not sure what demos Mr. Larserio has, but the one I am
talking about is called the 'ST-Connexion Sound Demo', it comes from a group
in France.

543. STe summaries -- post.

Newsgroup: comp.sys.atari.st
Date: 1990-06-30 06:22:18 UTC
From: Metalist@cup.portal.com
Message-ID: <31276@cup.portal.com>
Source record: 240014

Due to unprecedented demand, here is the STe summary:
Here are the STe summaries you requested. Please note that the postings are not in chronological order.

From: daniel@pkmab.se (Daniel Deimert; Orebro Tech. College)

In article <30957@cup.portal.com> you write:

>Please, inform me: Is the STe incompatible with the ST? Or is this
>just a bunch of baloney? Those of you in Europe, Canada and elsewhere
>{ave had access to the STe for some time now. What problems does it
>possess? I thought it was just an ST, though enhanced with a few extra
>goodies like better color and sound and a few extra ports.

It is not fully compatible. Games tend to use a lot of non-documented features of the "original" ST, and so they won't work on the STe.

I'm currently working{in a local toystore, and around 30 % of the ST games we have DOES NOT work.

New games (1990 ->), though, seems to work fairly well.

On the whole, the new features DOES NOT impress. The sound is plain raw sampling, which can be played in only five or six different frequencies. And forget about the palette, noone will use it, since it won't work on the ST.
Hardware scrolling is nothing to care about, the LYNX do it much better. If you wanna play -- buy an Amiga or a LYNX. Not a STe.

The only things which is _really_ good are the blitter and the possibility to upgrade with SIMMs.

From: AAron

Ya, I've got an RF modulator, and 4 1megx8chip simms in my 1040STe
I used two Macintosh 2meg memory upgrade kits, and they are 100ns. I was told not to get any slower than 120ns.

yep, once ya got them, ya just pop out the 256x8 simms and pop the new ones in! Cake...

Dragon's Lair? no, haven't even heard of that one, so I don't know if it supports the extra colors.
BUT I have a friend's SPACE ACE, and it DOES support the xtra colors.
Only makes for better fades between scenes (I saw it on a MEGA2 also)...

hummm... Metalist, have I seen that name in the music sigs?
Do you know Dean Swan? Do you have an ST?

From: sun!eua.ericsson.se!Arto.Nummelin

Hi, I bought my 520STe in December '89. With it came a bunch of programs
called the 'Power Pack'. The games included were

Pac-Mania Nebulus Bomb Jack Afterburner
Super Hang-on Black Lamp Space Harrier Overlander
R-Type Starglider Double Dragon Outrun
+ 8 more which I can't remember now.

Of these R-Type didn't work.
I have also downloaded many of the programs from comp.binaries.atari.st
and all of them worked except for the 'mem' command in gulam.

So as I see it it seems that the STe is almost compatible with the ST
and when it isn't I guess it is because the programs use direct adressing
of some memory variables instead of using standard system calls.

I have upgraded my machine to 2 meg with two SIMM's. Very easy, about
5 min work. I have also connected a 5.25" 360k drive to it by using an
old drive from an IBM PC. This works fine if I use a small program which
changes the steprate for the B: drive.

From: gl8f@astsun7.astro.Virginia.EDU (Greg Lindahl)

The "Mega problem" was that games accessed "secret" GEMDOS, VDI, and
AES variables at fixed locations in memory... under TOS 1.0. Atari
said "don't do that, we are going to move these variables". So when
the Megas came out with TOS 1.2, Atari had moved the variables, and a
lot of games that had broken the rules broke.

There was a short flurry of patches, people explaining how to patch
old games to get the variables in the new locations.

From: eric@castle.edinburgh.ac.uk

Hi!

I posted a similar question a couple of months ago (although I
don't particularly care about whether ANY games run on the STe as
I don't play computer games -- personal taste: I get bored in
minutes from most games!). Following is a summary of what I got
in response.

Good luck! Hope this little bit helps,

eric

==========
First of all, thanks to everybody that answered my posting.

Essentially, the answers to my two questions are:

1. the STe's are compatible with everything I would want one for (mostly
editors, compilers, shells, and terminal emulators).

2. all kinds of different answers although Third Coast Technologies got
the most votes (not that the number is statistically valid :-).

I have included all useful (i.e. > 0 information content :-) responses
at the end of this posting.

Again, thanks to everybody that answered!

eric

----------//----------
----------//----------
From: Herbert Sauro <eang62@ed.castle>

I saw your mail on comp.sys.atari.st concerning STE compatibility. Four
things I run regularly are:

Mark Williams C - no problems so far
TeX from Tools of W. Germany - no problems so far
Gulam - if you ask for free mamory it bombs out, otherwise seems ok
Prospero Pascal - no problems so far.

I think you'll find that the majority of serious software runs without
problems. Its probably mainly games which are having problems with
compatibility. Basically don't believe what you read in the mags,
expecially ST Format and those weeklies.

Herbert Sauro
Genetics, KB, Edinburgh

PS I have a 2MB STE (SM124 of course) + home-made hard disk and I am
quite happy with it (especially the price, 450 pounds for 2MB STE).

----------//----------
From: olorin@ed.cs.tardis

I've just got an STE myself (4 meg 600 quid from best prices).
The following stuff I have checked and it appears OK.

GCC , Minix , Gulam , TeX ... I'll check Uniterm.

Mind you there's a rumour going round of an imminent price increase ...

----------//----------
From: "Jwahar R. Bammi" <bammi@edu.cwru.ces.curie>

eric,
i have second hand report from people who use some of the stuff
that i wrote/ported that it all works on the STE (and TT, some of the

stuff was shown at Ceebit), this list includes:
gulam, gcc, TeX (StTeX, undump, BiBTeX), zmdm (terminal emulator with
x/y/z modem).

gulam: dont use the 'mem' builtin command, and you'll be ok.
no one have reported any other incompatibility.

------------------------------------//------------------------------------
From: Graham Thomas <grahamt@susx.syma>

Eric,

I'd appreciate it if you'd pass on whatever answers you get. I'm
thinking of getting an expanded STE myself.

The hard disk question is tricky, isn't it? We've had reasonably good
reliability from our Atari SH205s and Megafile 20s, but they lose out a
bit on price/performance. Supra disks have been a bit flaky (I know of
three which have been ordered. Each has had to be sent back to be
replaced. Frontier have been very good with support, and two of the
three replacements have been reliable.) The Power Computing disks look
tempting in terms of price, but I don't trust the company (not from
personal experience - just things I've read about them from other
users). The Vortex drives are heavily advertised in German mags, and
are probably wery well made, but they're a bit more expensive than
others. Third Coast drives might be the best compromise. I've not used
any, and the company, I've heard, is a bit small and chaotic, but I've
not heard of serious problems or dishonesty.

Cheers,

Graham

------------------------------------//------------------------------------
From: CSTMCS@stafpol.cr83
Sender: "JANET CSTMCS@UK.AC.STAFPOL.CR83" <CSTMCS@stafpol.cr83>

I think the best on the market at the moment is the THird Coast Technologies
65Mb or 85Mb drives. These are reasonably large, and relatively cheap.
(65MB = #599, 85MB = #699) Both will take a second internal hard drive, which
if it's SCSI embedded, can simply be plugged in. TCT offer a 4.5% educational
discount, which you'd probably be able to use if you work at Edinburgh Uni.

As an alternative, since the TCT drives are so easily upgradable, you might
like to buy a smaller unit, and add an additional drive. In Micro Computer Mart
there are regular advertisements for 40Mb Scsi drives for about #100. In the
last issue, there was even a 85Mb Nec drive for #150.

Finally, the TCT drives are some of the fastest available (typically 25ms) and
have favourable reviews in various magazines (ST World, Jun 89 (?), ST User,

Aug 89/May 89 etc. THe 85MB has a removable drive mechanism for security.

I'll be buying a 65Mb drive next month, so if you get good reviews of other drives, could you forward the details to me, (though I have checked the competition very thouroughly:-)

Good luck,

Mark

From: SCOFFIN@ox.vax

>From :
Rob Scoffin
Inorganic Chemistry Laboratory
Oxford
SCOFFIN@uk.ac.oxford.vax

I have just read your plea in info-atari16 for largish Atari HD's. We have two 65Mb drives bought from Third Coast Technologies in Bradford (look in any copy of ST User for details). The drives come in pretty "basic" cases but they seem well made and have enough space (and power supply potential) to add a second drive or a tape streamer (TCT sell their disks redy fitted with 40Mb streamers if you like). The disk driver software and utilities provided seem much better than the stuff that comes with the "Real" atari drives.... The last time I looked at their ad's I think they were offering 105Mb (all the way from 20Mb upwards) at quite a reasonable price... So far we have had no problems at all with either drive....

Hope this helps....

Robbie Scoff

From: Ralph Haglund <qralph@se.lth.dna>

Hi,
I am not in England, but I can always say what I would do...
Obviously buy a STE520 and put in SIMMs myself.
Get a 105Mbyte hard disk from Germany for DM1999. Fast, SCSI. I got an 85Mb in August from that same company that now sells that beast. My disk slowly died with more and more errors (after all it is a Seagate, the 105Mb one isn't...), returned the whole a few weeks ago to Germany, and a few days back I got paper from the customs here that it was back, they just wanted a few additional papers to show it was a return so I wouldn't have to pay customs twice.
Dunno what you plan to do - I occassionally do service on Ataris so I am not afraid of opening them up...

From : THE SLAYER
In message 1972/0/988, METALIST

Hey dont tell anyone I told ya, but I
heard from a guy in Oregon that th
> STE is available in OREGON!

The STe is already available, but from what I've read, they aren't all
theyre cracked up to be...sure they have stereo and 4096 colors, but
you can mod a reg. ST...(i have a tweety board (3D stereo) and a 16Mhz
upgrade with Math Coprocessor.)...The bad thing is, the STe has TOS 1.6
which is even worse than TOS 1.4 from what I've read in mags...they had
a list (about 2+ pages) of games, VERY recent games, that would not
run on the STe...and thats only games...who knows how many utilities,
term programs, etc. wont work...they should have had 4096 and stereo
from the start, that way everyone would program around the standards
the everything would be compatible...that's one area where the Amiga has
the ST beat...
[] Slayer []

From: sun!eua.ericsson.se!Arto.Nummelin

>How long have you had your STe?
Since December '89.

>Could ya point out the good/bad points.
Good:
- SIMMs
- Blitter included
- stereo sound via 2 RCA connectors
- 4096 color palette
- CPU socketed => easy to add PC emulator
- some improvements in TOS:
-possible to move filed/folders
-(sorry should have been files/folders, I can't edit previous line)
-some more I think

- plus all the good points of the ST

Bad:
- not very many programs that uses the new features (color, stereo)
- some new bugs in TOS:
- sometimes when I double-click on a program, the (SHOW) (PRINT)
alert box appears
- if I try to access a disk and the disk isn't inserted the
(RETRY) (ABORT) alert box appears. If I then click on
the (ABORT) the machine very often bombs. If I insert
a disk and click (RETRY) everything is ok.

>How much did it cost per 1 meg x eight chip SIMM strip?
I bought them via an ad. The guy who sold them had ordered them from the
USA for I think $89/SIMM.

From: clarkson.edu (AAron,,,)

I put four 1 meg by 8 chip 100ns SIMMs into my 1040STe and have had no
problems accessing the 4meg they give me. They were part of a standard
Macintosh memory upgrade kit. You must get EIGHT chip SIMMs (like the
Mac needs) for your STe, NOT NINE (Like the IBM needs) or TWELVE(like the
DEC Rainbows need).
The extra chip on the 9 chip SIMMs lets the computer detect most memory
access errors, (Due to solar flairs or a disturbance in the force, or just
because it wanted to flip!) because it holds the parity bits.. The 12 chip
SIMMs have the extra 4 chips to not only DETECT the errors, but to even
CORRECT them!!

I purchased TWO:
MICRON TECHNOLOGY, INC.
PC Enhancement Product
Xceed 2MB Memory Expansion Kit(s)
for Mac II SE/Plus (Low Profile)

They have worked perfectly for me, and people are wondering what works.
This is the reason I am bringing this information forward.
I'm not a "I liked it so much I bought the company" ...

From: sun!eua.ericsson.se!Arto.Nummelin

> Thanks for the information! Could I ask you how you upgrade using SIMMS??
I opened the case by removing 7 (i think) screws. (One screwhole was covered
by a Atari seal, so I guess don't have any guarantee for the machine anymore)
I then removed a shielding plate fastened by 4 screws. Then I took away
the 2 256k*8 SIMMS and replaced them with 2 1M*8 SIMMs (the Mac type, but
if you get hold of 1M*9 SIMMs, they can also be used although one bit is unused).
I tried to put the 256k*8 SIMMs in the 2 empty slots but that didn't work,
the machine kept rebooting. So I sold my 256k*8 SIMMs unfortunately, since
I saw later in a comp.sys.atari.st article that someone had a little program
that made it possible to mix the two types of SIMM's.
Well after putting back the shielding plate and the cover I now have
a 2080STe. When I get enough money I`ll buy 2MB more so I can use some
of the more memory consuming programs like GNU C++ or GNU Smalltalk. Since
I don't have a harddisk I also use Ramdisk which takes a lot of memory.

Hope this clarified something.

*** END OF STe SUMMARIES ***

>
>Uh, how do you do 4-channel sound on a 3-channel sound chip? Yes, I
>understand you can quickly change pitches on a channel to simulate a
>second channel, but I think this will sound awful. So how do you do it?

It's even possible to use just _one_ of the soundchip channels, if you
don't care much about "hi-fi" :-)

Seriosly spoken, the basic principle could be described like this:

a) all sounds are samples -- not "beep"-style (ym/gi soundchip, that is)
b) play four sounds at the same time, by simply adding them together

The hard work is to calculate when to play what... When you
whish to change the frequency of the sound, just play it slower or
faster. This effect can easily be achieved by using tables with true
or false values, which of course are pre-calculated to save time.

I think there are a few commersial programs on the market that makes
use of this technique. [One is from Tommysoft {Germany}, the other
program I know of is from Worksoft {Sweden}. (Actually, a Swedish
demo-progammer from the more or less known group "SYNC" is the author)]

Hope this helped you out,
daniel

From: depeche@quiche.cs.mcgill.ca
Message-ID: <3639@calvin.cs.mcgill.ca>
Source record: 240016

I was really curious to see what would happen if I wrote a program on the
ST compiled under Laser C and then recompiled it in Turbo C in Supercharger
mode. Although screen manipulations are slow on it, everything else
seems to be quite fast. I used an Othello program, and noticed a
1.23 speed increase factor when I was in Supercharger mode as compared
to my ST in native TOS mode (even though I had quickst installed).

So I guess that I am going to use it for heavy number crunching from now on..

553. Re: Unix on the Atari ST

Newsgroup: comp.sys.atari.st
Date: 1990-07-01 17:48:40 UTC
From: ericco@stew.ssl.berkeley.edu
Message-ID: <1990Jul1.174840.7379@agate.berkeley.edu>
Source record: 240022

I like Un*x. I like my Sparc 1 at work. I like X. I like NFS. Too bad that Laser C on the Atari provides a comparable compiling environment AND is faster for development.

I don't know that exact nature of the speed problem on the Sparcs, but I think that its the multi-processing environment in Un*x. Start up times for processes are measure in seconds, since the kernal must create a new virtual machine for each process. The performance of such a system makes it unreasonable to associate a single window with a single process -- the time cost is too high.

I recently used a flight simulator on a Sparc -- incredibly rudimentary, just like stuff you see on pcs (BTW, it also used a graphics accelerator board). I think its slow because to the multi-processing philosophy -- the sever gets the mouse events, figures out who owns them, sends them off, some computations are done, a bunch of graphic primitives are sent back, which the sever displays. Meanwhile, various processes are being swapped in and out memory. The bottom line is that the sparc machine is much more powerful than pcs, but its user interface performance is not.

I've also used Lisp Machines and Xerox Interlisp machines. These guys are multi-tasking, and the interface has a much higher throughput. Multi-tasking is coming back in vogue, with top people at Sun indicating that they are interested in moving in this direction. There is much discussion about light weight processes.

For the Atari ST, multi-tasking is really the only choice since it can't provide the virtual machine environment required for multi-processing. I suspect the OS/9, Minix, and MTcsh are all true multi-tasking OS. I expect that no one would be able to tell the difference between multi-processing and multi-tasking code that was well written.

Of course, there is the system resource problem in multi-tasking -- usually memory violations in poorly written code. But, the underlying implementation of MTcsh seems like a very reasonable start at sharing system resources such as disk drives, etc. Use of a sophisticate language like Lisp would eliminate memory violations.

In short, I think that there is a place for machines like the Atari ST in the future. But developers (and users) need to focus on computing in the 90s, not what was in fashion in the 80s. Light weight processing in a robust environment is certainly an obtainable goal for the Atari ST.

> other keyboards that will work, I'd appreciate hearing about them too...)
>

Putting a Mega-ST keyboard on a 520-ST, 1040-ST, etc. is trivial.
ALL that is needed is a cable adapter. (In fact I've seen a couple of
Atari dealers selling a Mega-ST keyboard as a separate spare-parts kit,
exactly for this kind of use. The price was around $130).

Of the six wires coming from the Mega keyboard, two are power (+5v), two
are ground, one wire is data from the keyboard, and one is data going
to the keyboard. Connect those to the appropriate four pins on the ST
motherboard and you're ready to go.

I've done this to one of my systems, but I don't have exact details
about pinouts with me.

558. Re: QuickST vs TurboST

Newsgroup: comp.sys.atari.st
Date: 1990-07-02 04:34:49 UTC
From: nrc@cbnews.att.com
Message-ID: <1990Jul2.043449.14282@cbnews.att.com>
Source record: 240028

First a little disclaimer, I own the fourth copy of Turbo ST sold and I have been beta testing for SofTrek since not long after that purchase. I am personally responsible for holding up the release of three different Turbo ST updates by discovering bugs at the last minute. :-)

I am speaking only for myself. The folks at SofTrek are much too busy for this sort of thing.

In article <1996@electro.com> ignac@electro.com (Ignac Kolenko) writes:
>
>As I have stated in a few postings to this newsgroup, I have left the
>company as a full time employee. I am still a developper for Branch Always
>since anything I develop will be marketed through Branch Always, and I will
>be paid royalties. Branch Always is still around, and as long as Turbo ST
>exists and is upgraded, so will Quick ST.

This strikes me as an odd way to define your company's product. Perhaps you've just worded it poorly but it sounds like your product exists not to meet your customer's needs but rather to compete with Turbo ST.

>Quick ST supports GDOS fonts, Turbo ST doesn't.

This could be misleading. True, as of the latest version of Turbo ST I don't think SofTrek has replaced any of the OS functions that deal with GDOS fonts specifically. But this does _not_ mean that Turbo ST will not speed up many programs that use GDOS fonts. The best example is Publisher ST where I can scroll through a typical page up to _twice_ as fast with Turbo ST as without.

I suspect that the reason they haven't replaced GDOS fonts yet is that they've been pursuing speed improvements in order of what would seem to be useful to the largest number of costumers. Their time spent specifically on speeding up Word Perfect (which I hear Quick ST still doesn't affect significantly) has probably been a greater boon to their users than time spent speeding up GDOS.

>That's all there is to it. Unfortunately, since Darek is
>currently in the process of moving to Seattle to begin his real job at
>Microsoft (boo hiss - the MSDOS people! :-) there's no one around to
>respond to questions. I sincerely hope that people out there can understand
>this current situation and not draw any hasty conclusions from it.

This is sort of silly. You ask that we please excuse your lack of support while you get on with your 'real jobs' but you ask that we don't say that there are any problems with your support? Producing

Turbo ST _is_ the people at SofTrek's "real job." They're attempting to make a living _supporting_ ST users the way they expect to be supported. That explains the price differential between the two products in a nutshell.

>I for one know that we have done
>more than SoftTrek has ever done (I have never received anything from
>SoftTrek about Turbo ST upgrades being available, except for 1 newsletter.
>Their upgrades are more expensive, and frankly, for the few percent
>difference in speed between Turbo and Quick, I think there is no question
>that Quick ST is better. unless some of you out there can really tell
>the difference between 1300% and 1305% or whatever the current numbers are.)

More than SofTrek has ever done? I can't agree. SofTrek was accelerating STs before there was any other way to do it, no blitters, no Turbo16 boards and certainly no Quick ST. I don't know whether there would have even been a Quick ST were it not for Turbo ST.

Your claim that the difference between Quick ST and Turbo ST is merely the difference between a 1300% and 1305% acceleration (numbers arrived at with Branch Always' own benchmarking program) is a gross over simplification of the issue. A benchmarking program may or may not reflect how a software accelerator affects a user's real world application.

When the first demo of the commercial version of Quick ST came out claiming based on benchmarks to be nearly as fast as Turbo ST I gave it a try. My experience at that time was that while Quick ST did speed up some programs nearly as much as Turbo ST there were other programs, some of which I use heavily, where Turbo ST held a significant advantage. I also noticed that at least that version of Quick ST seemed more bomb prone than Turbo ST.

I'd recommend that anyone who has chosen Quick ST over Turbo ST based souly on benchmarks and/or price try one of the Turbo ST demos that can be found on GEnie or perhaps your local BBS. You may find that the difference in your day to day applications is greater than you have been lead to believe by the "benchmarks."

If so, now's the time to find out because I'm told that SofTrek will be giving a discount on the purchase of Turbo ST to anyone who sends in their original Quick ST disk. According to the press release for their latest update (version 1.82) the offer is good until September. The announcement should be in the latest online newsletters soon. I can email the announcement to anyone who can't find it elsewhere.

559. Re: Pictures on the ST (Amiga's side!)

Newsgroup: comp.sys.atari.st
Date: 1990-07-02 07:16:58 UTC
From: hyc@math.lsa.umich.edu
Message-ID: <1990Jul2.071658.16558@math.lsa.umich.edu>
Source record: 240029

Well, just to add more deadweight to the dying discussion... I've just finished porting Fractint 12 from MSDOS to the ST, and along the way I added some "new" video modes as well. I added 4-color grayscale to the monochrome resolution, and made the medium resolution 16 colors, and the low resolution has a palette of 256 colors. From my calculations, the available palette is 512 * 511 / 2 = 130816 distinct colors. The 4 color grayscale is nothing wonderful to look at. Downright ugly, to be honest, but it would look good on a monitor with high-persistence phosphor. The low resolution mode looks pretty slick, though. Most of these fractals look really gorgeous with 256 colors.

The trick is pretty obvious, it seems. Just use two screens, and flip the physical page on every vertical blank. This effectively doubles the number of bits per pixel, and as expected, squares the number of colors that can be displayed at once on screen. It also introduces an incredibly annoying flicker... But hey, Amigans settle for a megapixel display that updates at 15 hertz, 30 hertz is a lot better. Sending 4 complete screens at 15 hertz on the ST would give, what ... 64K displayable colors out of, oh... 36 bits worth of palette. Not that it'd be incredibly worthwhile.... You'd really need the same kind of monitor that the Amigans use - an intelligent one that assembles the video frames in an internal buffer.

Going to monochrome is a slightly different story. If you just use two screens and flip back and forth between them, you'll get dark, half-light, and light. To get 4 distinct levels of grayscale, or to make the significant bits really significant, you have to display them onscreen for a longer period of time. But that's pretty easy too... So, the 70 hertz monochrome video is split up into a low-significance image sent for one-third of the time, or 23.3 hertz, and the high-significance image is sent at 47 hertz. The flicker here is really really noticable. Anything slower than 30 hertz will be, of course. Turning the brightness down or getting a monitor with high-persistence phosphor would cure that problem....

Ok, I guess I've rambled long enough. I've had a lot of fun getting this code working, and I personally think the doubled video modes are kinda neat, even if the monochrome flicker is as obnoxious as a fluorescent light...

Now... If you're really really crazed, you can do vertical blank image switching *and* horizontal scan palette switching at the same time. I don't think it's really practical for general purpose drawing, or for drawing fractals either, for that matter. Limiting color selections on a per-scanline basis just seems like too much hassle to deal with. But if you wanted to try it, you could draw yourself... 256 * 3 swaps per line * 200 lines = 153600 colors per screen. I guess that's a bit excessive, given only 130K colors in the palette.

SO.... I hope this discussion is really, truly dead now, so we can get to more interesting things. Meanwhile I'll be submitting fractint for posting Real Soon Now. (But sometimes, ya gotta wonder. Why are you spending all these cycles drawing these silly pictures???)

I have two Atari Megafile 44, one at home and one at work. They are very reliable. I find it very confident to take the cartridge with me and have the same working environment here and there.

You do not need a SCSI interface for the Megafile 44. You just plug it in and start working. In fact, you can install an additional SCSI harddisk in the case. You only need to open the case and use the already-there plug to connect the harddisk - at least I was told so. (I did not yet open the case for it is still under warranty.)

Source record: 240031

I have a Mega-4 and I am no longer able to choose the 'Blitter' option from my menu or from NeoDesk (2.05).

Does the Mega detect the presence of a blitter automattically and then add it to the menu??

If so, is my blitter 'toasted'??

If my blitter chip is 'toast' how do I go about getting a replacement?

Or, should I not worry about the blitter & just purchase Turbo/Quick ST??

Thanks in Advance

Hey, bud, our screens (640x200, 320x200, etc.) update at 60 frames per second.
ONLY our interlace mode updates at 30 frames per sec. DON'T even start!!!

ALso, we have a blitter and many co-proc's and the ONLY "co-processor" YOU
have is a DMA controller, BIG DEAL! Later

567. sh204 problems

Newsgroup: comp.sys.atari.st
Date: 1990-07-02 18:33:59 UTC
From: brunk@wheaton.UUCP
Message-ID: <2097@wheaton.UUCP>
Source record: 240035

A few weeks ago my Atari SH204 hard drive started bombing and now I am unsure about what to do to fix it. Here is a brief history of what happened and the solutions I used:

-brought my hard drive (heads parked) to a friend's house to connect with his hard drive. He had a FA/ST 80Mb drive. We never got them to work and that was the first time I saw my drive act up. The busy light would stay on all the time once the computer was switched on, and it would not respond.

-took my drive back to my dorm room and reconnected it to my 1040STf. The same problem occurred again. I played with the cables a little and finally got it to boot normally. I use Atari's auto-booting software v3.0.

-I then copied some files from floppy to HD and soon found out that the filesystem on that partition had been corrupted. I then used Simon Poole's DL II optimiser/checker which seemed to really screw things up. I then tried TuneUp! which couldn't fix the errors either. Both complained that there were discrepancies between FAT #1 and FAT #2.

-after completely reformatting the hard drive (and losing about a month of work) and restoring what I had backed up, I thought I had everything under control until a week later the same thing happened again.

-I then ran a program that measures disk rpm's and found that my drive varies as much 20 rpm's when consecutive tests are taken. I am not sure of the reliability of that program but I became worried that it was correct. If I listen very carefully, I can hear a high-pitched squeal that seems to fluctuate around a little when I turn my HD on.

Has anyone ever experienced similar problems? Someone did tell me that it might need a good cleaning since it has been in dorm rooms for 2 years now. If that is true, is it worth getting it cleaned or should I just spend my money on a new drive. This drive is about 2.5 years old and I have never had any problems like this before.

Any help would be greatly appreciated.

Thank you very much,
Rob

568. Should I purchase a NEW 1O4OSTE or a USED 1O4OST?

Newsgroup: comp.sys.atari.st
Date: 1990-07-02 20:59:04 UTC
From: Metalist@cup.portal.com
Message-ID: <31354@cup.portal.com>
Source record: 240038

I have a dilemma. I do not know if I should purchase a Used 1o4oST color system or a NEW 1o4oSTe color system.

Money is no object, since I can afford either alternative. However, I am beginning to consider whether the STe is really such a bargain.

Many used 1o4oST color systems can be had where I live for $4oo. A brand new 1o4oSTe color system will cost me close to $1OOO.

I would not mind getting the brand-new 1O4OSTe color system. In fact, this is what I wish to purchase. However: I need to know, does anyone know how much longer the Atari ST series will be in existence?

If the STs survive another 5 years, I will definitely go for the brand-new 1O4OSTE. Yet, if the STs will not survive much longer, I think it would be wiser for me to purhase a used 1O4OST and start saving up for a TT.
If anyone can help me with my decision, please send me mail to the address located at the end of this letter.

Your help is much appreciated.

Thank you,

Metalist@cup.portal.com

569. FAST Binary Transfers

Newsgroup: comp.sys.atari.st
Date: 1990-07-02 21:27:34 UTC
From: whitten@kuhub.cc.ukans.edu
Message-ID: <24845.268f75f6@kuhub.cc.ukans.edu>
Source record: 240039

I recently developed a set of programs, one for our VAX 8650 running VMS, and one for my 1040ST, which allows me to download 8 bit binary files (such as .ARC) from the VAX across the 7-bit packet switch network in a Xmodemish fashion.

I did this mainly because of the slow transfer rates I was experiencing using Kermit in 8-bit quote mode. The faster rate is accomplished by doing some bit-encoding, and sending the data in 1k packets.

Are there any other people out there that have similar systems and have are tired of the long transfer times? I would be interested in hearing from anyone who would like to try this thing out and give me their thoughts.

Please E-mail me at either of the addresses below.

Thanks,
Chris

If I read you correctly here, Howard, you're under a misconception: the standard monitors used on Amigas are not intelligent. They are analog RGB, NTSC or PAL compatible (depending on country). You may be referring to the use of multiscan monitors in conjunction with de-interlacing video cards which buffer interlaced scan lines in local RAM before sending the signal to the monitor to remove the flicker inherent in interlaced NTSC/PAL signals.

Please, Amiga owners, be polite when visiting other groups. There's no need to start flame wars over differences in various system designs. Leave religious fervor in the realm of metaphysics.

Newsgroup: comp.sys.atari.st
Date: 1990-07-03 03:52:43 UTC
From: kgg@zinn.MV.COM
Message-ID: <787@zinn.MV.COM>
Source record: 240041

Heh heh. We used to have a program on the PDP-12 (!) that used
this technique to put out two voices on one channel,
complete with the pre-built tables to speed up output.
Actually, I think it was eventually a compiler system
that took in "note files" and wrote out "play files",
and then a player program that just read the "play files"
and dumped them to the speaker.
But I think that at some point it could do it interactively
by using tables.

This seems pretty impressive from the discription.

>flicker... But hey, Amigans settle for a megapixel display that updates at
>15 hertz, 30 hertz is a lot better. Sending 4 complete screens at 15 hertz

This is incorrect. The Amiga monitors refresh at 60Hz, all the time.
The screens with Xx400 and greater are interlaced which gives an apparent
refresh rate of 30Hz. 1/60th for each of 2 fields making 1 full image
refresh at 1/30th.
The 1200x400 and greater mode still refreshes at 30Hz, with each pixel having
half as much data letting you use 4 colors.

15Hz would be unusable!!!

Are all Amigans so paranoid that the Atari might have its strengths, too, that you all read atari.st just to make sure no one likes their machine? Fact correction is OK, but the Amiga/ST flame war is DEAD. Don't start it again -- it's what kept us and still keeps us from seriously challenging IBM/Apple. Both machines were rushed to market in buggy versions to compete with each other, and both user communities have flamed each other instead of enjoying their systems. Capishe?

Nice job of cutting down on the quotes there, "bud." Note that I said on a
so-called megapixel display. I have it on good authority that the 2024 monitor,
which displayes 1024x800 pixels, is only redrawn at 15 hertz. Granted, it's
a fair amount of work getting 800K pixels onto a screen, but this display
will only spit out 4 gray levels for all that time & effort spent in
interleaving frames. My "garbage" Atari with "no coprocessors" puts out
an 800x500 monochrome display at 70 hertz. For 4 graylevels I drop down to
35 hertz or so. For me to stoop to the slow redraw speed the Amiga spits out
I can gain another frame time, for 16 gray levels. And this is on a stock
Atari monochrome monitor, not some jazzed up $700 "megapixel" tube.

I didn't bring this up to dump on your machine, I was merely quoting a figure
for the sake of comparison. No need for an antagonistic attitude...

[But since you brought it up ... *One* DMA controller is more than adequate,
given a powerful enough selection of devices attached to it. In my case, I
happen to have a NeXT box attached to my ST, and I've found it pretty adequate
for most of my multiprocessing needs.]

>But I think that at some point it could do it interactively
>by using tables.

I guess a PDP12 beats this story, but I certainly remember this from my Apple II days. Electric Duet was a lot of fun, before I'd been exposed to better... (Pokey Player on the 800... }-)

Y'know, as someone said, by adding the frequency values together you can encode a pretty cheesy 4 voice sample into a single channel of the PSG. Well. Given that, why not .... 2 voices per channel on two channels each, and reserve the 3rd channel for sonic holography data? Heck, then I'd finally have something cool to use with my Tweety Board.

(After all, in current hi-fi surround-sound systems, there's only one channel of sound going to the rear speakers...) Boy, I guess I really wanna hear what that German 6-voice demo sounds like now.

Could someone please email me details on how I can get hold of these demo disks? I'm willing to send floppies anywhere for the likes of this. And if it's doable, I'll have the stuff up on terminator.

Hm..... I guess what we need is a program that reads a bunch of physical sectors, slams 'em thru a 16 bit compress, and spits out a file on the other end... And the reverse, of course. Or maybe tracks. Whatever...

Exactly.

>If so, is my blitter 'toasted'??
If the blitter option showed up before, yes. If not, you probably don't
have any blitter. You might test this using the Xbios Blitmode function:

```
if (Blitmode(-1) & 2) puts("Yep, there is one.");
else puts("No blitter, no cry.");
```

580. Re: QuickST vs TurboST

Newsgroup: comp.sys.atari.st
Date: 1990-07-03 13:48:52 UTC
From: ignac@electro.com
Message-ID: <2074@electro.com>
Source record: 240049

I publicly retract ALL that I have said about Quick ST and Turbo ST in my
last posting. I have received all kinds of flak over what I have said,
and since I don't work for Branch Always Software anymore, I really don't
need or want the flak.

Both Turbo and Quick are excellent products, and they deserve the best
support from all Atarians. If I sounded harsh and critical, it was because
I perceived that other Netters were hacking Quick ST to pieces, and I became
a little defensive at the time. I am quite sorry. Please accept my
apologies.

but, just one point i'd like to make ... :-)

In article <1990Jul2.043449.14282@cbnews.att.com> nrc@cbnews.att.com (N. Richard Caldwell)
writes:
>This strikes me as an odd way to define your company's product.
>Perhaps you've just worded it poorly but it sounds like your product
>exists not to meet your customer's needs but rather to compete with
>Turbo ST.

unfortunately, competition is what keeps the western economies alive and
kicking. Darek at the time he began to tinker with the idea of quick st
saw that Turbo ST was a necessary idea, but since it was the only product
out there, it was far too expensive and he felt it needed some competition.
The customer NEEDS an INEXPENSIVE solution, and we offered it.

this sounds like the old complaints about how Atari itself doesn't offer
the same level of support as does a company like Apple. if you buy a product
which costs far less than the competition, then you have to realize that
there are reasons for such price differentials.

while we sold Quick ST as shareware, the author of Turbo ST claimed we
were unfair competition to Turbo. Now that Quick is commercial, there are
still problems with competition?? Sorry, but Darek enjoys what he does
(and i did enjoy it until all this crap started recently) and he will
continue to do so indefinatly. so get used to it, atari world! competition
will continue to exist!

now please, let's not see any more flame wars about either product, OK?
Let the consumer make the informed choice over which product to choose through
impartial third party reviews, demos at Atari shows, user group meetings,
etc. I've been using Quick now for over a year, and i like
it. Mr. Caldwell has been using Turbo for a few year, and he likes Turbo.
So which is better?? It's not up to me or him to decide for the atari world.

cheers!

Can I put in a plea that this not become July's first full-fledged overblown war of words between opposing camps? Turbo ST and Quick ST each have good and bad points, they are both well-supported products, and the competition between them has doubtlessly made them both much better products.

Both sides have made informative postings, let's not have it degenerate into mindless name-calling.

(So far it hasn't, I'm just trying to prevent it).

Thanks!!!

Yes, the Atari Megafile 44 is available in the US, and has been for several months now... Atari quietly slipped it into distribution with no fanfare, no marketing, and very little availability.

They're available at your local Atari dealer... if you're lucky enough to live anywhere near the approximately 43 Atari dealers left in the entire country...

You might call Atari Corp and see if they'll sell you one directly... or a better idea might be to contact a company that's actually interested in selling a product like this, like Toad Computers or ABCO for example.

What's the program's name? I don't think the difference of 20 rpms should
bother you; it's most probably the program's fault. Try the program with
other drives, and you'll see.

>Has anyone ever experienced similar problems? Someone did tell me that it
>might need a good cleaning since it has been in dorm rooms for 2 years now. If
>that is true, is it worth getting it cleaned or should I just spend my money on
>a new drive. This drive is about 2.5 years old and I have never had any
>problems like this before.
What do you want to get cleaned in a hard disk? The disk drive itself is
sealed and will never come back to life if you'd try to clean it.

To summarize, you should do some additional tests on your hard drive.
What kind of ST do you own? STEs like to trash your hard disk data
sometimes, and the MegaSTs with those IMP chips installed have other
problems concerning DMA transfers, especially over long cables, or if
there are more than two drives connected to the DMA bus. Check your
cables. Try one from a friend. Try to get your hands on some low-
level check program for your SH204. (I have written one and would
like to send it to you via snail mail if you send me a disk. At the
moment, I can't post it, sorry.)

From: joep@tnosoes.izf.tno.nl
Message-ID: <1211@tnosoes.izf.tno.nl>
Source record: 239967

Because I want to add MS-DOS to my atari, I was thinking of
PC Speed. But last week somebody told me about the possibility
of changing the ST into an AT. Has somebody already seen this
hardware?

My local dealer told my it's not available in the Netherlands (yet) and
when it is, it costs about the same as PC Speed. Is it already for sale
in the USA or Germany? How good is it? Any information is good.

Joep.

From: curt@quest.UUCP
Message-ID: <10173@quest.UUCP>
Source record: 239966

A Question about the Atari Portfolio computer.

A friend of mine is travelling to Europe soon and plans to take her
Portfolio with her. What dangers will the Airport metal detectors
and X-ray machines be to it? Any horror or "Took a licking and
keeps on ticking" stories. Suggestions are welcome.

I would rather part with my left ear than part with my 1040.

WAIT! It might be DANGEROUS... You go first.

600. ST/Amiga Blitter & ST OS (CP/M/GEM?)

Newsgroup: comp.sys.atari.st
Date: 1990-07-04 15:05:42 UTC
From: arc@desire.wright.edu
Message-ID: <746.2691bf77@desire.wright.edu>
Source record: 239971

Here's a "nice" question for you ST people. It's about the blitter, of course. I know you guys can "hack" and put a blitter in the 520/1040, and that the MEGA, STe(?), and TT(?) come with one. But what are the blit sizes for those blitters? Our "old" blitters are 1Kx1K and the new ones (which started beginnish of last year) are 32Kx32K blit sizes... I hope SOMEONE CAN ANSWER THIS! OH, ONE MORE important question. A programmer friend of mine told me that ST's OS (1.4 in the 520/1040?) is/was CP/M with a GEM overlay? Is that true? And, if you DON'T know what the heck you're talking about, PLEASE DON'T REPLY, I'm sick of stupid people.

THANK YOU,
Jim...

> Anyone know the mail path to Atari?
>

The trouble with paths is that they vary depending on where you are.

portal!atari!<whomever> and sun!imagen!atari!<whomever> may work if
you can find a path to those better-known sites (sun.com, portal.com).

I have found that rutgers.edu and plains.nodak.edu maintain very
reliable UUCP path databases. When people mail to thelake!steve
instead of steve@thelake.mn.org, the mail usually goes through one
of those two sites.

Atari Corp. really should get a registered domain address. It doesn't
cost anything to speak of and you don't need an Internet connection.

There is a program called Magic Shadow that can be used to send non
TOS format disks over the net and recreate them at the far end. It could be
used for the Union demo above or for the netter looking for the CPM emulator
system disk or even for Spectre/Magic Sac/Aladin disks, but not I think for
real mac disks. It's PD and available from several mail servers.

Padraig.

The KA9Q is a ham radio callsign. Armed with that knowledge you could also
have gone to a public library that has a copy of the ARRL ham radio callsign
directory and found his (or her) address and written them directly.

610. ATARI CDAR504 CD ROM PLAYER

Newsgroup: comp.sys.atari.st
Date: 1990-07-05 17:38:16 UTC
From: hcj@lzsc.ATT.COM
Message-ID: <1956@lzsc.ATT.COM>
Source record: 239988

Notes on the CDAR504.

Since the only traffic dealing with the CDAR504 I have seen is my own,
I may be speaking in a vacuum. Nevertheless, here are my observations.

ATARI has made the CDAR504 available to DEVELOPERS at a very reasonable
price. Further, there is evidence of plans to release a demo CD of
ATARI software, which implies that sometime dealers will have CD players
to use. And Sell?

I bought one of these beasties, to see what it would do.

1. I tried it on a Music CD. The CDAR504 plays them. There is even a
DA to allow cataloging the tracks of multiple CD's. NEAT!

2. There are no native ATARI CD's yet. (Or least, I don't have access
to one). So no comment on their use.

3. There are lots of MS/DOS Data CD's. I got hold of two that are intended
for IBM PC's using the Microsoft CD Rom Extensions (MSCDEX).

The CDAR504 comes with software that functions similarly to MSCDEX
which allows trapping all the GEM OS calls the access files and
permits doing it the mscdex way. (Remember we have file systems
of == 600 million bytes; far exceeding the gem/ms-dos limits of
32 million bytes).

The CD's may be opened from the desktop and files accessed, read,
copied, and the like, without limitation. Of course it is hard
to copy a file of 200 million bytes to something else. The real
problem is that most of the data is compressed and is meant to be
read with a program supplied in the directory structure of the
CD rom. If the program had been native for an ATARI it would
surely work. Unfortunately, the programs are for IBM PC's.

4. I modified PC-Ditto I (a true emulator) to interface to MSCDEX and
permit accessing the CDAR504. Now I can access the whole disk
and display the encoded information. It is copyable also.

5. Next I got an Apple demo CD. This is a true multi-media (nice buzz
word, right!) disk. It has 5 tracks on it, tracks 2 and 3 are
speeches describing how great the CD is. These tracks play on
my Sony CD player; NOT on the CDAR504. TROUBLE here!!

When I try use the CDAR504 to read the contents of the data tracks
it refused.

Problems with a CDAR504.

1. It turns out that this device internally will access only 2 types of CD rom data structure:
A. Music. The magic code is MUSIC, and multiple tracks may be specified. This can be played, but the binary read commands are disallowed. No looking at the bits!!.
B. Data. The magic code is DATA. A MSCDEX compatible CD then describes 1 track (containing the whole disk). This can be read, but not played as music.

2. A Multimedia CD (as Apple does it) is structured as:
A. The magic code is DATA, but multiple tracks are specified. Think of this as the same as the partitioning of a Hard Disk. The tracks serve to give Start and Extent, not Content.

The CDAR504 handles this disk by allowing reads of track 1, and blocking access to the other tracks.

A Conclusion.

I bought the CDAR504 knowing only that it would play music, and read a yet to be produced Atari CD-rom. I found that it will read and support the common CD-roms for the IBM PC using the MSCDEX software. Finally I found that it will not read multi track data cd's which I suspect covers most of the multimedia ones that combine voice and data.

Hopefully, ATARI will see this and consider potential changes in their CDARxxx product line if it is ever released.

Jim, The underlying OS for the ST is TOS it stands for Traimel
Operating System (if I spelled his name wrong forgive me) it is its
own entity but from looking at the bios and xbios calls it seems to be
losely based on MSDOS, probably due to GEM being a MSDOS application
ported over to the Atari (and it also explains the compatabilties
between disk formats). But it is not a MSDOS clone as a lot of the
underlying structures (interupts and memory addressing) and it does
not use loadable device drivers (all device drivers are loaded as
TSR's). CP/M was used in the prototype of the ST but it was found to
slow the machine too much so it was scraped.

613. Proposal: COMP.WARS newsgroup

Newsgroup: comp.sys.atari.st
Date: 1990-07-05 18:42:48 UTC
From: owen@euclid.enet.dec.com
Message-ID: <13107@shlump.nac.dec.com>
Source record: 239977
Cross-posted to: comp.sys.amiga,comp.sys.mac,comp.sys.ibm.pc,comp.sys.atari.st,news.groups

At school we had a conference called 'COMP.WARS' which basicly was the place where all should go to try to prove that their computer was better than the next guys. It was mostly a battle of home computers, so it was IBM vs AMIGA vs MAC, but anyone was invited. It was usually a pretty heated battle, but personal flames were against the rules.

It was nice because it kept the flame wars out of the actual computer conferences (news groups), and it shed some light on each computer's capabilities, weakneses and strengths.

What do you all think of having such a news group? Either comp.wars, or alt.comp.wars. As far as I know, there is no such conference now, and I think it would be fun and interesting to have one.

Discussion? Pros/Cons etc... let's hear it!

I think it would be a good idea to keep the discussion for this news group in NEWS.GROUPS where it belongs, but you can send your ideas to me at owen@euclid.enet.dec.com.

PLEASE don't send me your opinions about yours or other computers, that's what the news group will be for, should it become a reality.

>15 hertz, 30 hertz is a lot better.

You're confused about the Amiga megapixel display. While it's true that the entire display is logically updated at either 10Hz or 15Hz (selectable), the actual video refresh rate (eg, will it flicker?) is 60Hz in the 1008x800x2 mode, and 50Hz in the 1008x1024x2 mode. You don't see any flicker on these displays. But they're not suitable, in the high resolution modes, for real time on screen animation. Not that anyone using a monochrome display is all that concerned about animation anyway. The simple case of the mouse pointer "animation" is handled by "mouse-tracking", where the quadrant or sextant of the logical screen containing the mouse pointer is updated more often. Note that, to the system, the screen looks just like you'd expect a megapixel screen to look, it's only the actual screen driver that must perform any special tricks to display on one of these monitors.

The TT has no blitter. Blitters don't make sense in a 68030 system with
burst transfers. Well, not much sense, that is.

>THIS! OH, ONE MORE important question. A programmer friend of mine told me
>that ST's OS (1.4 in the 520/1040?) is/was CP/M with a GEM overlay? Is that
>true? And, if you DON'T know what the heck you're talking about, PLEASE DON'T
That's not correct. TOS is based on GEMDOS which is much more of a DOS clone
than some CP/M derivate. GEM, consisting of AES and VDI, sits on top of it.

> mentioned) CAN be run, because the characteristics that those programs
...

A friend and I tried this very thing with our STe's and TOS 1.0 on disk.
It helped "a little"... some programs that bombed right away, didn't
bomb right away, but did bomb a little later due to something else...

A good example: ST-TALKER, a neat speech synthesizer. Bombed under TOS 1.6
when you tried to make it say ANYTHING. With TOS 1.0 in memory, it
spoke, but bombs when you try to pull out the extra speech settings window.

But the benefits of the STe far outway the disadvantages as I see it...

I think it already exists. It's called alt.religion.computers. It does
not stop the "wars" that typically are the result of crossposted
questions, or worse crossposted opinions.

Note: followups are directed to news.groups, which is where a discussion
such as *this* belongs. It does NOT belong crossposted to all the
comp.sys.* groups in sight!

From: saj@chinet.chi.il.us
Message-ID: <1990Jul6.040051.10256@chinet.chi.il.us>
Source record: 239993

I hesitate to speak in the same discussion with Howard, who knows device drivers awfully well. But from what little I've been able to learn, (another reason I hesitate--I don't have one) the CDAR504 and its driver software have been designed for greatest flexibility. Physical and logical disk access functions are separated as much as possible. The boldness of the attempt should be viewed in light of the fact that for PC applications, it's now common to regard the CD ROM, the player and the access software as one purchase. It's unsafe to presume ANY degree of interoperability. In this context, the serious problems mentioned aren't all that discouraging. The ST may yet become the universal CD reader. It clearly isn't there yet.
On a related note: can anyone tell me how to get the documents describing the CD ROM 'standards'? (High Sierra and ISO something-or-other). I can see a few applications, but I don't know remotely enough.

OH, ONE MORE important question. A programmer friend of mine told me
that ST's OS (1.4 in the 520/1040?) is/was CP/M with a GEM overlay? Is that
true? And, if you DON'T know what the heck you're talking about, PLEASE DON'T
REPLY, I'm sick of stupid people.

The ST's OS, which is TOS (Tramiel Operating System in the good old
days, The Operating System nowadays (official name from DR as I read
from csbrod?), Thirty-two Operating System (32-bit, geddit)) is from
Digital Research, which wrote CP/M. While they were writing the OS for
the ST, they based it in CP/M 68K, a version for the MC68000, and
that's where the CP/M base comes from. Mind you, it's just based on,
not real CP/M.

An official DA from ATARI? Why didn't I see that all the time?

>2. There are no native ATARI CD's yet. (Or least, I don't have access
> to one). So no comment on their use.
The German software company MAXON collaborated with ATARI Germany and
Bertelsmann in producing a CD-ROM containing nearly 200 PD disks. This
CD comes with every CDAR504 in Germany; at least that's what ATARI
says when I checked the situation some months ago.

There's also been a demo CD with some demo software from several German
software companies that had been produced for the 1988 ATARI fair in
Duesseldorf.

> The CD's may be opened from the desktop and files accessed, read,

> surely work. Unfortunately, the programs are for IBM PC's.

Rumours say that there is a software package from a Dutch company
that allows some of those DOS CD data to be retrieved on the ST.
I think they said something about CDs that can be viewed under DOS
with the Microsoft Bookshelf environment.
>4. I modified PC-Ditto I (a true emulator) to interface to MSCDEX and

Neat hack! Several readers of my book asked me for something like
that. Would you like posting it? How did you do it?

> speeches describing how great the CD is. These tracks play on
> my Sony CD player; NOT on the CDAR504. TROUBLE here!!

Right. The CDAR504 can _not_ handle CDs with combined music and data.
I tried with an early firmware version and made suggestions to ATARI in
order to change that. (Not very difficult, I think.) Is Mr Schmal listening?
What's the current firmware version?

However, most of the porting of Phil's code to the ST has been done by
amateurs in Europe, DG2KK and recently PE1CHL. Distribution of current
ST code in the US has been a problem, I've mailed out more diskettes than
I would have preferred because of this.

Not only could you have gone to the library, but in northern California
anyway you could have used tcp/ip to finger the amateur radio database
which n6oyu runs and gotten the information via radio. Of course
if you only have an Atari that might require the very code you were trying
to get it ....

Not a good idea. KA9Q is Phil Karn's call sign. He write the
"original" MS-DOS versions of the code. Other people then write the
variants, such as the Atari version. Walter Doerr DK2GG (or DG2KK?) did
one of the ST ports; a later one comes from somebody in Holland. A
better notesfile to ask in might be rec.ham-radio.packet.

Give me a break. Encoding this stuff takes maybe 30 bytes, tops. (I
used to write video games, and this kind of stuff is pretty common--you've
got 10 bytes sitting around, so you encode something cute in it. BFD).
If they had 'easter-egged' it, so that if you did something funky
like bring up a dialog box, then hit ALT-SHIFT-CTL-F1-F2 and they
pop a message to that effect, _then_ I'd be upset, 'cause that takes
a chunk of codespace. But 30 bytes? Sheez.

(P.S.-Neil Harris hasn't worked at Atari in quite a while. He works
for Genie now.)

There is a product called Baby Duck or some similar that does
just this. But the guy who built these things got tired of it,
I guess, and designed a software product that does the same thing.

The program is called "duck31" by Larry Rymal. As it comes, off the
shelf, it is designed to boot off a floppy, wait 15 seconds, and then
issue a command to do a cold boot. By that time, your hard drive might
be up to speed. The time delay is settable. You can get it from
the server "terminator".

I heard one horror story recently. A friend of mine brought a portable
on the plane. The X-ray operator took extra interest and scanned it
a couple of times. After this it would not boot, because, apparently
the hard drive was wiped clean. Best explanation I have heard yet is
this: The X-rays themselves do not hurt the magnetic media, but the
focusing coils do.

Does anyone else know about problems like this?

641. Argv/xarg protocols - help!

Newsgroup: comp.sys.atari.st
Date: 1990-07-06 22:21:03 UTC
From: dhollis@shiloh.UUCP
Message-ID: <202@shiloh.UUCP>

In-Reply-To: <1990Jul6.030726.24719@wolves.uucp>
Cc:

I have both a software and a hardware answer to your question.
I bought (yes, hard cash flowin') a pcb and some electronics that,
basically, on power-up is holds the ST's reset button signal HIGH (or
low, wichever is applicable) for a configurable amount of time.
The ST will then boot after the installed time.
The software solution (the reason why I never got to building in my
PCB board) is a program I've written that waits for a certain amount
of time and then resets the ST. Since a floppy must be present in drive
A: at boot time anyway (that is, unless you're patient enough to wait for
the drive to time-out) it is no problem to have to have an AUTO folder
containing this program present on floppy at boot time.
If you insist on having it the hardware way, mail me and we'll arrange
for you an instruction how to build it (I have to draw the darn thing in
that case).
If you forget about the hardware stuff you can send a request for the
software way.
I might even consider posting it to comp.binaries.atari.st.

645. fread problems in MWC when loading my STE samples!!

Newsgroup: comp.sys.atari.st
Date: 1990-07-07 18:33:35 UTC
From: AAron@image.soe.clarkson.edu
Message-ID: <1990Jul7.183335.3152@sun.soe.clarkson.edu>
Source record: 239865

I am writing an STe digital sample player, and am having a problem with fread.

```
count = fread(buffer, size, n, fp);
```

I give it all the correct parameters, and verified this by printing them
out beforehand.

The problem is that the command won't ALWAYS read the "n" bytes that I request.
"count" ends up less than "n".

Since I am doing this several times in a row (and advancing the "buffer")
to load large samples, there are gaps in the sample when it is played.

Does fread stop when it encounters a certain byte code, thinking it has
reached the end of file?

AAron nAAs Yes, once I get this STe digital sample player totally working,
I WILL post it to the net!!

AAron@sun.soe.clarkson.edu

647. Waiting for HD boot - A software solution for a hardware problem :-)

Newsgroup: comp.sys.atari.st
Date: 1990-07-07 19:25:03 UTC
From: jeff@quark.WV.TEK.COM
Message-ID: <7605@orca.wv.tek.com>
Source record: 239867

I had the same problem with my ST. My solution was rather 'plain' but simple, cheap and effective. I've got an imbedded SCSI drive on my ST, with an ICD host adapter. (The SCSI drive w/ICD often takes two "reboot" cycles even if the drive is up to speed.)

What I did was to create a blank floppy, and in it's auto folder is:
(in this order)
icdboot.prg
coldboot.prg

If the hard drive does not boot, then coldboot runs, and the cycle continues until the HD is ready. Once the HD is ready, C:\AUTO is used rather than A:\AUTO.

649. Re: ST/Amiga Blitter & ST OS (CP/M/GEM?)

Newsgroup: comp.sys.atari.st
Date: 1990-07-08 00:13:01 UTC
From: kgg@zinn.MV.COM
Message-ID: <795@zinn.MV.COM>
Source record: 239870

I never used CP/M extensively, but I clearly recall that the command-line interpreter of CP/M was an immediate descendent of those of the traditional (i.e. pre-VMS) DEC operating systems -- TOPS-10, RT-11, OS/8. I haven't used MS-DOS extensively either, but I can use it in a pinch mostly because it, in turn, looks a lot like CP/M. So, I suppose one could say that, to the extent that TOS is based on MS-DOS, TOS is indirectly based on CP/M, except that the window/mouse user interface doesn't look anything like the user interface of either MS-DOS or CP/M. Just a bit of history...

From: kgg@zinn.MV.COM
Message-ID: <796@zinn.MV.COM>
Source record: 239871

I'd have to rummage around on my disk to figure out anything about their origins, but I've got *three* different versions of MicroEmacs that run on my 1040 ST. None of them are Jove or Gnome. One of them is called 'me' and comes with the the Mark Williams C package, and the manual for that states that it (MWC) runs on either a 520 ST or a 1040ST. The version I have is sufficiently old that I doubt they even considered a 1-meg 520 ST, so I'd say that this constitutes a sort of existence proof.
One of the other two uEmacs's ... uEmacses ... versions of uEmacs that I have is a fairly stripped-down version that is meant to be called directly from the desktop. I suspect it would fit in 512k. I *think* it came with sources, but I'd have to check. The third one is called 'em', is fairly fancy, and my gut feeling is that it wouldn't fit in 512k.

652. debugging mangled .arc files

Newsgroup: comp.sys.atari.st
Date: 1990-07-08 02:01:46 UTC
From: kgg@zinn.MV.COM
Message-ID: <798@zinn.MV.COM>
Source record: 239873

There's probably a newsgroup that deals more directly with the ARC utility, but I notice that many folks in this group use it, so I'll start here...

I have a bunch of .arc files, comprising all my Usenet mail for the past three years, that I recently created from raw 'mbox'-format files. The very next day, I ran arc -v on them, and 5 out of 7 of them were corrupt! The messages indicated one or more bad headers. In most cases, there were two bad headers; the message for the first was legible, but the message for the second was itself garbled. Apparently by that point it was so confused that it looked no farther. When I tried to extract the files from them (-x), the resulting mail files were quite short compared to their original lengths.
The worst of it is that nearly all the mail that I've exchanged with various of you since I joined this (atari.st) newsgroup in March is gone.

Does anyone know of a utility or technique(s) whereby I could repair these files so as to reclaim most, if not all, of the archived material? Obviously, if a "header" is corrupt, there's not much I can do about the block to which the header belongs, but I hope that other blocks thereafter can be found and recovered.

Help!??!!

Don't worry about the memory upgrade, worry about the version of TOS. If both machines use the same version of TOS, and both have double sided drives, I don't know of any other incompatibilities. I've had an upgraded 520 for about two years (and the 520 itself since November 1985) and have never had problems. Of course I'm still using TOS 1.0.

>you do it anyways? Any responses would be appreciated...

Simple. Link into the hdv vectors. Let them point to routines that return
2 (hdv_mediach), -14 (hdv_rw), or deinstall themselves (hdv_bpb), i.e.
something like this:

```
my_rw:
move.w $e(a7),d0 ; drive to read/write
cmp.w ourdrive(pc),d0 ; drive to fake media change on?
bne.s rw2 ; no, goon
moveq #-14,d0 ; Media changed
rts
rw2:
move.l old_rw(pc),a0 ; get old rw vector
jmp (a0) ; jump to the old routine

my_med:
move.w 4(a7),d0 ; drive to check media status
cmp.w ourdrive(pc),d0 ; drive to fake media change on?
bne.s med2
moveq #2,d0 ; media changed
rts
med2:
move.l old_media(pc),a0 ; get old mediach vector
jmp (a0)

my_bpb:
move.w 4(a7),d0 ; drive to get BPB from
cmp.w ourdrive(pc),d0 ; you know which drive-...
bne.s bpb2
move.l old_rw(pc),hdv_rw ; restore vectors
move.l old_media(pc),hdv_med
move.l old_bpb(pc),hdv_bpb
move.l old_bpb(pc),a0
jmp (a0)
```

After you've done that, do some dummy GEMDOS call like Fopen("X:\\YYYY")
where X is the drive where the media changed shall be faked on and YYYY
is a file name that may or may not exist. In this moment, GEMDOS calls
the BIOS routines: Mediach() and Rwabs() return 'changed', so GEMDOS
calls Getbpb() to reinitialize drive data. It also forgets all about
the drive, including folder info and things like this.

Remember to use XBRA when linking into the BIOS vectors (I omitted that
for reasons of brevity). The code above is not guaranteed to work -
it's 2 a.m. and I badly need to sleep.

By the way: You'll find a detailled description on how to this in
the TOS 1.4 release notes.

660. More Time Bandits Stuff...

Newsgroup: comp.sys.atari.st
Date: 1990-07-09 00:23:30 UTC
From: jamesl@CIE.UOREGON.EDU
Message-ID: <9007090023.AA16125@cie.uoregon.edu>
Source record: 239879

Hi again! I'd like to thank everybody who helped me out in response to my last question. I am now the proud owner of six artifacts and well along in the game. I do have a couple more questions that I hope somebody can help me with. I'm really not very good at these sorts of games (this is the only one I even play!) and am appreciative of any help I can get.

1. I've discovered that not all the areas in the game contain artifacts. Can somebody tel me which areas don't have artifacts in them? So far I've found six, and confirmed that one other doesn't have an artifact in it. I think there must be at least one or two more, from the spaces in the display where the artifacts are shown.

2. There is a teleporter maze in the Guardian that is virtually impossible to navigate. I've tried several times to follow I. Jones' map, with no success. Whenever I take a wrong step I am placed in a corridor which forces me to leave the level, and replay the entire thing to try again. Now, this game has some hard puzzles but this one is just a bit too complicated to be fair. Am I missing something somewhere? Is there an extra key I haven't found? (if you've played this part of the game, you'll know what I mean.) Has somebody successfully negotiated the maze and made a map that works?

Anyway, thanks for your patience and your help...

(Please send replies via E-mail to avoid wasting bandwidth.)

Source record: 239880

```
Re: Forcing media change.
There is a pd autoboot program around called FMC,I believe,which will force a
media change on your floppy drives. If you need to do this in your own program,
I did it once by stealing the vector at $47e,then using this little routine to
replace it.
my_mc:
move.w 4(a7),d0 * drive?
move.l sys_vec,a0
cmp.w #$c,d0 * you talking to me?
bne .sk1 * no get lost
cmp.w #0,dc_flg1 * copied a disk lately?
beq .sk2 * no then use rd vec
move.l #ret_err,a0 * otherwise tell tos to look again
.sk1 jmp (a0)
.sk2 move.l sav_vec,a0
jmp (a0)
ret_err:
moveq.w #2,d0 * disk has definately been changed
move.w #0,dc_flg1 * only need to check once
rts
Note that this was written to support loading a ramdisk (M) with a floppy
as a sort of an un-Turtle program. The system would not look at a ramdisk
for a media change as I loaded the ramdisk by using the ramdisk memory as a
track buffer.
```

663. Hard drive write protect

You are probably going to get swamped with people saying that the Tweety
board and the STe's new digital stereo sound chip are COMPLETELY different.
This is because it's true.

The Tweety board just outputs each of the standard Yamaha sound chip's
three channels to three different RCA jacks. It is amusing, and makes
some things sound nicer, but a friend of mine who has/had it, didn't find
it all that impressive.

I HAVE heard that the color palette upgrade that was available before the
STe's (well at least in the US) is compatible with the extended palette
in the STe.

Don't even let the idea of putting TOS 1.6 into your MEGA enter your mind...
It's not going to happen.

Along the same lines...an interesting anecdote.

When Microware was writing the OS for the Tandy Coco III there was ~6K of ROM space left over, which Radio Shack instructed to "fill with garbage". The authors of the OS digitized a picture of themselves and put in a small routine to display it upon pressing Alt-Ctrl-Reset (reset is on the back of the Coco). Try it next time you're in Radio Shack - the clerk will have NO IDEA how that picture got there!

>to be sure all his usual programs will work on my machine. Are there
>any compatibility problems between a 1040 and a 1meg 520?

I've been using such a system for about 2 years (gosh thinking about it its probably longer - doesn't time fly) with a fairly large range of software (both games and applications) and I haven't had any problems. The 1040 and the 520 both use the same boards, so if your upgrade is of the 'buy the bits yourself and plug them in' form there is no difference at all. I don't know about the various 'solderless upgrades' but I would suspect there to be no problem

670. Disks for sale

Newsgroup: comp.sys.atari.st
Date: 1990-07-09 12:09:35 UTC
From: roger@tippy
Message-ID: <1990Jul09.120844.13040@tippy>
Source record: 239887

I've got some public domain/shareware disks that I'd like to sell if anyone is interested.
There are 27 disks from BRE Software (most are games and kid's programs with some utilities/applications such as ST Xformer, JIL Cad, Fontmaster, QT Com, ST Writer, and lots more. Most are fairly new, ie. less than a year old.) Also, the 6/90 STart disk, Atari Interface Disk 6&7/90 and 8/90, a King's Domain clip art disk, and the 1/90 through 6/90 ST Informer disks.
This is a total of 37 disks, and I'll take $70 for all of them (no, I won't sell just part of them.) That's less than $2 a disk, which is less than half-price. E-mail or call if you're interested.

Thanks - roger (317) 474-0379

672. Disinfectant 2.0 for Mac emulators

Newsgroup: comp.sys.atari.st
Date: 1990-07-09 13:38:48 UTC
From: matthews@umd5.umd.edu
Message-ID: <6846@umd5.umd.edu>
Source record: 239896

Sorry if this has been posted already (as far as I know, this information was made available last night), I don't read comp.sys.atari.st any more. But I thought this would be of interest. It's a new Disinfectant release (Macintosh anti-virus program) that makes specific reference to viruses that *only run on some Mac emulators on Atari computers.*

Here's the press release:

Disinfectant 2.0
================

July 8, 1990

Disinfectant 2.0 is a major new release of our free Macintosh anti-viral utility.

The main goal of version 2.0 is to provide a complete and free solution to the Macintosh virus problem in a single package (in fact, in a single file). Version 2.0 addresses all four aspects of the virus problem: detection, repair, protection, and education.

Version 2.0 includes a new virus protection startup document (INIT). The INIT is designed for use by novices and others who find existing protection INITs to be too complicated and obtrusive.

Version 2.0 has a much-improved online manual, with pictures, printing, a context-sensitive help system, and many new sections of information.

Version 2.0 is a non-modal application with standard windows and menus. It supports desk accessories, printing, MultiFinder application switching, and scanning in the background.

There is a new Preferences window which can be used to specify miscellaneous options and parameters.

Other new features include more scan and disinfect options, new counters in the main window, and a much-improved scanning station feature.

Version 2.0 also recognizes the Frankie virus. Frankie only affects some kinds of Macintosh emulators running on Atari computers.

Disinfectant 2.0 is available now via anonymous FTP from site acns.nwu.edu [129.105.49.1]. It will also be available soon on sumex-aim.stanford.edu, rascal.ics.utexas.edu, comp.binaries.mac, CompuServe, GEnie, Delphi, BIX, MacNet, America Online, Calvacom, AppleLink, and other popular sources of free and shareware software.

Macintosh users who do not have access to electronic sources of free and shareware software may obtain a copy of Disinfectant by sending a self-addressed stamped envelope and an 800K floppy disk to the author at the address below. People outside the US should send an international postal reply coupon instead of US stamps (available from any post office). Please use sturdy envelopes, preferably cardboard disk mailers.

>> the 1040ST until the hard drive gets up to speed?
>> (other than the listen and then flip switch interface :-)
>>
Well I use a desk accessory (called HDWAIT?) that you put on a floppy and I just leave this in the machine when I turn my machine on (everything is on a powerbar). It waits to see if the hard drive is there and if it is boots off the hard drive. If not it waits a while and tries again...If anyones is interested I'll post it to binaries.

676. STe Hardware scroll

Newsgroup: comp.sys.atari.st
Date: 1990-07-09 18:01:26 UTC
From: micro@imada.dk
Message-ID: <779@imada.dk>
Source record: 239702

```
Hi;

Does anyone know why the STe hardware scroll, won't work in monocrome mode?
-or even better how to fix it (software!!!) :-)

The problem is that this simple program don't work :
vbl:
movem.l d0-d1, -(a7)

move #LineLen - N_Planes, D1
move Offset, d0
addq #1, d0
and #%1111, d0
move d0, Offset
bne no_fng
addq #N_Planes, D1
no_fng:
move d1, LINEWID
move d0, HSCROLL

movem.l (a7)+, d0-d1
rte

it's installed as the only program on the vbl, and all other interupts is
disabled...
N_Planes is 1 for mono, and 4 for Low res...
The program is shortned a bit for the sake of readability (it won't scroll
more than 15 pixels). But it ilustrates the point: the screen moves to the left
(physical) when HSCROLL becomes 0 (i think it's HSCROLL that triggers the jump).

PS it works fine in low res and the scroll in mono works, if HSCROLL don't
become 0 (which means that LINEWID is constant LineLen - N_Planes).

- Klaus (micro@imada.dk)

>
> On an unrelated topic:-
> Is the CPM emulator for the ST in the public domain? If so, is there anyone
> willing to mail it to me? Tell me first please. Thanks in advance.
>
According to a file included with the CP/M emulator, it does appear to be in the public domain, placed there by none other than Atari Corp. (who also appears to be the one who commissioned the port to the ST.) I got it off of Terminator, though I'll be happy to mail it to you if you wish. Please respond by email and I'll do it (its over 200K uuencoded/arc'ed so I don't want to be one of ten doing it :-))

I'm glad you asked about it though, since I use it occasionally, and find that a few pieces of functionality and information are missing and was thinking of bringing up the topic myself. First of all, I can't find any information about hard-disk support under CP/M, though the TOS filesystem commands can access the hard disk. Also, there's not enough info to make changes to CP/M itself like upgrading to ZCPR. (For those of you not familiar with it, the Atari ST CP/M emulator emulates a "documented" Z80, i.e. doesn't implement the undocumented Z80 opcodes.) If anyone can help, please post or email.

Terminator is back in the mail archiver server business. As of today Bart is ready for public use. To find out more about bart, send a message to atari@terminator.cc.umich.edu with a body of "help". You will get a message back with the help file.

Questions about bart such as how to use it or how to set up your own bartchive should be addressed to me. (jon@terminator.cc.umich.edu)

Questions about the archive such as why isn't the index perfect, what does this file do, what do I do with an arc file, and what is a booty and how do I know if I'm shaking it should be addressed to Jeff Weiner. (weiner@terminator.cc.umich.edu)

Thanks to all my beta-testers and code-reviewers. Special thanks to Jeff, Wes Craig, and Elliot Soloway respectively for the name, the knowledge and the time.

Jon Brode -- jon@terminator.cc.umich.edu Boycott {Apple,Lotus,Xerox}!

>
>
> Joep.
>

Yes, there is a direct successor to the PC-Speed, it's calles AT-Speed
and will be available in 3 to 6 Week's for about the same money of
the PC-Speed. It will have a Norton Index of about 6 to 7 and applies
to be very compatible. But there is another alternative, which could be
available in a few weeks / months. The AT-Once from Vortex, also a
german hardware producer. They announced it on the CeBit in Hannover
this year. It will cost as much as PC-Speed and have the same Norton SI.

Let's hope for good news in a few weeks

Bye...Michael

682. Waiting for HD boot - A software solution

Newsgroup: comp.sys.atari.st
Date: 1990-07-09 21:16:23 UTC
From: ljdickey@daisy.waterloo.edu
Message-ID: <1990Jul9.211623.14525@watdragon.waterloo.edu>
Source record: 239894

I tried two send directly to the original writer, but could not reach him.
Larry Rymal wrote a program called "duck31" that is available at the
"terminator" file server. It sits on the floppy in the AUTO folder.
It runs, waits 15 seconds or so, and then boots again. By then, maybe the
hard disk is up and running. I think you can adjust the number of seconds
delay.

683. Re: Forcing a media change

I have a little problem with my 1040ST which I just
bought used: the mouse doesn't work in the horizontal direction.
It's very strange, but no matter which way I move it, the cursor
moves to the right. The vertical axis is OK. If I move the mouse
really fast to the left, it may move in that direction, though.
Anyone, have any ideas about what may be wrong? I would especially
appreciate anyone in the Ithaca area who can give me a call, or
email.
Thanks in advance :-).

Sounds like the rollers need cleaning. Just pop out the ball and clean the "gunk" off the three rollers. If you are a little adventurous you can remove the two screws and seperate the mouse halves, this makes it easier to give the rollers a good cleaning.

Source record: 239709

I have just bought a Centronics Printstation 351 printer, Its a 132 column wide printer and I would love to run it off my ST. Anyway, the st acts like its going to print, and then just comes back without printing anything, I didn't get any errors either.

I read awhile back that this is a timing problem with STs. Has anyone got anything to help me? (I've tried some printer buffers, but they don't seem to help.)

Thanks,
Goz

694. Single Switch System Boot

Newsgroup: comp.sys.atari.st
Date: 1990-07-11 04:06:14 UTC
From: bms@bdt.UUCP
Message-ID: <3750@bdt.UUCP>
Source record: 239714

Recently, there have been a number of articles on the net concerning the problems associated with booting an ST/hard disk system. Most of the articles have dealt with specific solutions and haven't gone into any real detail about the problems and their causes. I've decided to take a crack at defining these problems and discussing the pros and cons of various solutions.

The Disk

As I'm sure we all know, hard disks are basically mechanical devices. This means that they operate orders of magnitude slower than the microprocessors they're generally used with. When you turn a disk on it could be 40 seconds before you'll be able to read any data. How a disk and its controller (embedded and otherwise) behaves during power-up places it in one of three groups.

The first group responds to any command with a "drive not ready" status until the disk is up to speed and ready to read and write. Drives from manufacturers like Micropolis, Imprimis, Priam, and Quantum fall into this group.

The second group, upon receiving a command, holds the SCSI bus busy until either the disk is ready, or a period of time (15-40 sec.) has elapsed. The hard disk then will either execute the command (disk is ready) or respond with "drive not ready" status (timeout). This group notably includes Adaptec controllers.

The third group responds by not responding. If the drive is not up to speed and ready to go it will not go busy in response to an SCSI select phase. This group notably includes Seagate SCSI drives.

Each of the above groups has its problems. The first group requires that the computer's boot code pole the drive until ready. The second group requires that the command timeouts be greater than the controllers timeout to prevent the SCSI bus from becoming hung. The third group requires that you wait around for the maximum power-up delay before deciding to boot the floppy.

The Computer

Inside your ST is a power-up reset circuit. Its purpose is to delay operation of the computer until the power has stabalized, any additional delay only gives you more time to twiddle your thumbs.

The ROMs

When it comes to hard disks the TOS ROMs really missed. The hard disk boot code manages NOT to work with drives in all three catagories. They don't pole for drive ready, they just try to read sector 0. They don't allow for long command execution times, you get 2 seconds. They don't delay than boot, they just boot.

The Boot Sequence

It's important to know how the ST comes up in order to know where we can reasonably make changes. After reset goes away the ST first tries to boot the cartridge at various levels. It then loads sector 0 off the floppy and executes it if the checksum is correct. Next, for each of the 8 DMA devices, sector 0 is read, checksummed, and executed if the checksum is correct. Only after attempting to boot DMA devices does the ST try to run programs from the auto folder.

The Solutions

1) Big Capacitor in Reset Circuit

Increasing the value of the power-up reset capacitor is a quick and dirty way of making the computer wait before accessing the hard disk. It has the side affect of making you wait no matter what the situation is, if you just push the reset button you wait, if you get a fast power-up hard drive you wait, if you're only booting a floppy you wait.

2) Sophisticated Big Capacitor in Reset Circuit

Along the same lines as the first possible solution is a circuit that only adds a delay the when power is applied and not when the reset button is pushed. This eliminates some of the more annoying aspects of solution 1 but still can make you wait. In addition you've now got to build this circuit from scratch.

NOTE: The above solutions can be reasonably applied in unattended systems like BBSs.

3) Hard Disk Cartridge

Making a cartridge with code on it to make sure the hard disk is ready before booting would definitely work. You could even have different versions for different catagories of hard disks. However it does preclude using the cartridge port for anything else.

4) Bootable Floppy

The "waitboot" utility included on the BMS distribution disk is an example of what can be put on the boot sector of a floppy. Waitboot operates by poling DMA device 0 until either it can read sector 0 or 40 seconds have elasped. This means that you only wait as long as it takes the drive to come ready. It also has the side effect of clearing a "unit attention" status.

5) New ROMs

This is the only real solution to the problem. If you're going to support hard disks you might as well have a booter sophisticated enough to do the job. This means poling the SCSI devices until they come ready and then loading and executing the boot sector. Handling things like "unit attention" statuses and devices that don't respond until ready are also part of this. Unfortunately this can really only be done by Atari as it would significantly increase the size of the boot code.

However, we can fix one bug in the existing ROMs. Within the DMA bus boot code there exists two timeouts, one is applied during the transfer of command bytes to the device, and the other is used to recover in case a device dies while executing a command. The first timeout is 50 milliseconds, this is really too short but can be left alone. The second timeout is 2 seconds, why? I have no idea. This timeout ONLY comes into play if the device has successfully received a command. By altering one bit in the ROMs from my 1040ST I've extended the timeout to 42 seconds, this allows single switch booting of my ST/hard disk (group 2) system. It's interesting to note that if Atari had put a reasonable value in here in the first place the original SH204 would have booted. The byte to be changed is at address $fc05da in the TOS 1.4 ROMs, the original value is $01 the new value is $21. I realize that this is only a cure for systems that use Adaptec controllers, but it is a real bug and should be fixed.

6) Auto Folder Programs

If you're using a hard disk from either group 1 or group 3 an auto folder program can be useful. When the ST tries to boot a DMA device it will get either "drive not ready" status (group 1) or no response (group 3). Both cases result in the floppy auto folder being executed. A program that simply delays then reboots would work but will probably need to be tailored for each system to minimize unnessasary delays. A better approach would be to pole DMA devices until ready then reboot. When used with group 2 hard disks auto folder programs won't work unless the controller has timed out (this would be the case if you'd modified your ROMs as above). This also won't get rid of a "unit attention" status as it will be recreated each time the system reboots.

What To Do

The ideal solution would allow single switch booting without requiring you to put in a floppy. This is possible if you have a group 2 disk and modify your ROMs. If you're using a group 1 or group 3 disk, or you don't want to modify your ROMs then waitboot should work. I'd stay away from reset circuit mods and auto folder programs.

697. Want a program that plays STe samples?

Newsgroup: comp.sys.atari.st
Date: 1990-07-11 04:55:51 UTC
From: AAron@image.soe.clarkson.edu
Message-ID: <1990Jul11.045551.3954@sun.soe.clarkson.edu>
Source record: 239717

I knew that would get your attention...

Remember me? I was/am the one complaining that there are no programs that use the new "stuff" in the STe?

Well.. It just hit me... Why don't I write something???

Hey, whoa, what a great idea!

Anyway, I have a TOS program that you give all kinds of fun parameters to that will not only play your samples, but will let you adjust alot of settings.

As of this moment, this is possible:

```
Usage:
[[-L[{R,L}]] <filename>] Load: Sample [Right/Left].
[-S <0xhhhhhh> <0xhhhhhh>] Sample Loc: Hex memory span.
[-M{S,M}] Mode: Stereo/Mono.
[-R{0,1,2,3}] Rate: 6.25/12.5/25/50kHz.
[-P{O,L,S}] Play: Once/Loop/Stop.
[-K] Keep: Protect sample memory.
[-I] Info: Suppress info listing.
[-HELP] Help: This list.
Key: Elements between [ and ] is optional,
An element between { and } must be selected.
Memory locations must be in hex and begin with '$'
If only <filename> is given, then it defaults to '-MM -R1 -PO'.
If -L[{R,L}] or -S is used, NOTHING changes by default,
which means it must specifically be told to play, and how.
```

Just thought I'd tempt all of you with what I'm almost ready to post.

The hard stuff is done, now all I gotta figure out what numbers to put in the MICROWIRE data registers to change master/left/right volume, treble, bass and mix. Believe it or not, this IS going to be easy once I figure it out... (I'm lookn at the STe DMA soundchip stuff posted to the net a few months ago, and the explaination of this isn't very clear, anyone understand it?)

699. DTP and Postscript Output

Newsgroup: comp.sys.atari.st
Date: 1990-07-11 12:53:24 UTC
From: GINGRICH-T@osu-20.ircc.ohio-state.edu
Message-ID: <12604810746010@osu-20.ircc.ohio-state.edu>
Source record: 239718

Publisher ST (Timeworks) supports PS output. My only complaint is the program will not allow you to use fonts bigger than 99 points (whereas regular postscript will allow up to 255 pts).

My favorite setup is to put Ultrascript in 1 revolver window & Publisher in the 2nd revolver window. This works very cleanly!!

Tyler

>"gunk" off the three rollers. If you are a little adventurous you can remove
>the two screws and seperate the mouse halves, this makes it easier to give the
>rollers a good cleaning.

Although if you've already tried this (obvious) solution, the chances
are that you've blown one of the horizontal i-r emitter/receiver pairs,
most likely the orange i-r led transmitter as these do break given
violent shocks. If this the case then you will have to refer servicing
to qualified personell.

On the other hand, check for breaks in the traces with a magnifying glass,
clean any extranious dust from the internal mechanism by the i-r pairs,
do a continuity check of all wires coming from the keyboard jack and,
if all else fails, ATARI will replace your mouse for just $25 if you
send in the dead one to an authorized service center.

Is all.

704. Icon Programming

Newsgroup: comp.sys.atari.st
Date: 1990-07-11 17:29:08 UTC
From: ericco@stew.ssl.berkeley.edu
Message-ID: <1990Jul11.172908.20348@agate.berkeley.edu>
Source record: 239723

Has anybody written any programs in Icon for the Atari ST?

I've just looked at some of the documentation on Icon. It looks like a comprehensive language and programming environment. I've used SNOBOL in the past and found it very interesting. In particular, the documentation states that there is a programming library that contains an object oriented system.

Glancing at the documents, it seemed that Icon's syntax is much more like C than SNOBOL. If someone has some simple (but not completely trivial) code samples of Icon to share, I would very much like to see it before investing time figuring out what Icon is like. I would be especially interested in any object oriented Icon code.

Thanks,
Eric

I have the stuff compiled, and it works just fine, but an important part of the program simply doesn't exist yet: the highscores file and associated routines. I was figuring to wait until Jim Wilson decrees what the standard would be (one nice thing about moria is that files are supposed to be movable from machine to machine) before posting anything. After all, it's pretty large. The old version works ok as long as you remember to set the date and time on your ST before playing. If people disagree with this attitude, mail me. I really hope the highscores stuff gets decided soon and this dilemma doesn't need to be addressed at all.
At last report, Wilson was a bit burned out, and didn't need a whole lot of mail asking him what's holding stuff up. He's done a great job, and is certainly entitled to a breather.
So if you must flame someone, I volunteer (to ignore flames). If you're impatient, write me a short note. I may be convinced to post the incomplete version. Or someone else may choose to.

I need help accessing Atari ST fileservers.

I have heard of Panarthea, and Bart. I need help with any listserv functions.

The ST section at my local net is pretty unimpressive, and lacks a version of VanTerm. I was hoping to access this and other files from Liserver and fileservers and ftp sites.

Once before someone provided me with huge documentation which I wish that I still had, but they are on my eight-bit and I know not how soon it will be before I can force myself to use it again. THE ST is a joy to use and I never want to go back!

Please send me mail?

Thank you

I have seen the Union Demo. It is amazing. I was told that over 900K
of data is on the disk. You have to run the demo to make copies of
it. I don't think it can just be copied or arced.

714. Laser C function call help needed! (slightly long)

Newsgroup: comp.sys.atari.st
Date: 1990-07-12 08:40:18 UTC
From: n8742883@unicorn.WWU.EDU
Message-ID: <1213@unicorn.WWU.EDU>
Source record: 239741

I have just purchased Laser C, and after a week of book hunting was able to purchase a copy of "The C Programming Language", second edition, by B. Kernighan and D. Ritchie. I was advised to buy this book as I was told it was the "bible" for C. I was learning a lot of the basic functions of C and having a pretty good time learning the language until I hit the section on functions.

It appears to me that Laser C is _not_ ANSI compatible, which really burns me. I got massive syntax errors when I tried to compile a simple function. The next page (p.26) the authors showed a "note of history" where "The biggest change between ANSI C and earlier versions is how functions are declared and defined...." and gave an example of a function "would have been written" in the older versions of C. I wrote the old version in and it compiled and ran perfectly.

Satisfied that I could overcome a small syntactical problem with the language, I went off to the next example which has an array passed to a function, and the function returns an integer value. The compiler hated it. I have tried for an hour to juggle the syntax around, but it still won't compile at all. The algorithm is as follows as per the book:

```
/* getline: read a line into s, return length */

int getline(char s[], int lim)
{
int c,i;

for (i=0; i<lim-1 && (c = getchar())!=EOF && c!='\n'; ++i)
s[i] = c;
if (c == '\n') {
s[i] = c;
++i;
}
s[i] = '\O';
return i;
}
```

The Laser C compiler screams bloody murder on the first line; It insists that there is a missing ')', missing ';', and then declares that there is an invalid function. I have tried to 'mimic' their example of 'older' versions of C programming by declaring the variables under the function declaration and removed the beginning 'int', thus reading:

```
/* getline; read a line into s, return length */
```

```
getline(s, lim)
char s[], int lim;
{
etc. etc. etc.
}
```

but the compiler still tells me that the function is declared wrong, and that the 'char s[], int lim' line is redefining what 's' and 'lim' were in the first place.

First question: How does one pass variables to a function in Laser C, and how do you declare that the function will return a certain type?

Second question: Is there a Laser C upgrade which meets the ANSI standards? I have heard a lot of good stuff about this language and find it hard to believe that it does not meet a standard that was set over two years ago.

My apologies if I've been verbose with my problem; I wanted to insure that I was specific in defining it.

Thanx in advance to any Laser C 'experts' out there!

Perry Pederson n8742883@unicorn.WWU.EDU

This is just the way it should be. If you send a SHIP command to a Quantum
drive, it will spin down and just sit there waiting for some reviving command
from the computer. If you look at some SCSI specs, this is perfectly OK:
The SHIP command really is called "START/STOP UNIT" in SCSI terms, so
that's what Quantum drives do.

>TOS 1.4 and TOS 1.6 finally have a completely DOS-compatible disk format.
I don't think so, look at disk free: Atari says something about 726016
Bytes, an IBM says something about 728112 Bytes free. But the new TOS
versions - thats correct - make an IBM like Bootsector.
If you want to have 100% IBM Disks, you can use Fcopy 3.0.

> Has anybody any idea to force the Multifinder to stop that??
>

Send in your Spectre registration card. Version 2.65 of the Spectre software
fixes this bug.

Tyler

PS: I mailed in my registration card & received ver 2.65 in only 6 days!!
This is the usual level of support provided by Gadgets, so I guess I
shouldn't be so suprised.

PPS: I've been having trouble printing Postscript Files w/ my GCR.
I need to know which 'laserwriter' file to use in the chooser. I have
Ver 6.02 of the system folder & the only 'laserwriter' file I can find
has the Appletalk wiring in the Icon. When I select this printer, print
PS, and convert the file the PS file has some appletalk activation commands
on the front. My question - is there a laserwriter file which works
directly (ie doesn't make me code PS). If there is, what does the
Icon look like, what is the EXACT name, and where do I find this file???

Thanks to everyone who replied. I got some helpful info
which showed me the right place to look. I fiddled around
with the thing last night, and managed to repair it.
So, here's what went wrong. Firstly, the mouse was
cleaned off, but to no avail. Then, I looked at some other
suggestions. The one that struck me the most likely was
that it something to do with the opto-thingamajig. And it
was. The rollers are on an "axle", and they have to be parallel
to the plane of the mouse base, i.e. they must not jiggle up
and down or left and right. The axle in my mouse was jiggling
vertically. If you look carefully at both the axles, you can
see that the ends are held down by plastic things (very sorry
I don't know the technical names :-)). The end with the
slotted wheel is held down by a plastic rod, which you can see
if you look down parallel to the axle through the hole in the
plastic post in which the axle end is held. Turns out that
that was loose on my mouse: I found that out by comparing it
with the vertical axis axle. Just put a small screwdriver into
the hole at the top (looking vertically down) of the plastic
post, you can push the plastic rod back down onto the axle to
hold it in place.
Now, about the screws. Those just hold the whole assembly,
circuit board and all, down to the mouse case. The reason that
fiddling with those screws works is that if you loosen them, you
make clearance for the mouse ball to jiggle vertically, and that
prevents the axle from jiggling.
Well, that's it. Thanks again for all the helpful replies.
:-) :-)

You can fix this one by changing the comma in the second line, to a semicolon.
More commonly (I think) is to put the different types on seperate lines. Ie:
char *s;
int lim;

> First question: How does one pass variables to a function in
>Laser C, and how do you declare that the function will return a
>certain type?
Ahh, thats two questions? When you define a function, place only the variable
names (not the types) inside the paranthesis (after the function name). To
specify the data type returned by the function, just place the type in front
of the function name. Ie:
```
FILE fopen( name, mode )
char *name, *mode; /* The comma is correct here since both
* variables are of the same type.
*/
{
static FILE file1;
etc. etc. etc.
return &file1;
}
```

>By the way, TOS 1.6 waits about 6 seconds for the harddrive to get up to
>speed before continuing to boot.

Actually, I think he meant 60 seconds. The actual number is 90 seconds.
If the manual that came with the computer didn't contain a comment
about this, it should have. The comment would read something like this:

"When you turn on your computer, the Floppy Disk Access light
will come on, then go out, then come on again. After this there is a
90 second delay, to allow your hard disk to become ready. If the hard
disk becomes ready in less than 90 seconds, or if you have no hard
disk, you can press any key to terminate the delay and continue the
startup sequence."

Believe me, people, I tried to come up with a solution which didn't
involve a simple delay. It turns out that hard disks vary widely in
their spin-up time, and also in their responses to commands between the
time they are powered up and the time they are ready.

Hitting a key too early will not stop the delay because the system
hasn't initialized the keyboard yet. Wait for the floppy access light
to come on, then go out, then come on again: that's when everything is
initialized, and you can hit a key to stop the delay.

The 90-second delay addresses the need for machines you can turn on
with one power switch, and most notably for unattended machines which
might come up all at once after a power outage. The logic goes like
this:

(A) 90 seconds is more than enough for all hard disks we're aware of.
(B) If you're there, you can hit a key when your HD is ready.
(C) If your system comes up unattended, an extra 90 seconds won't hurt.

726. Fixing a Blown Mega

Newsgroup: comp.sys.atari.st
Date: 1990-07-13 03:02:51 UTC
From: src@cs.odu.edu
Message-ID: <13103@xanth.cs.odu.edu>
Source record: 239758

I had a problem recently where my Mega 4 flat-out DIED while booting up recently. It got about ten seconds into my hard disk boot sequence, and went out like an expired coupon. No display, no LEDs lit, no fan running.

Let me explain: I know something of hardware. Before I panic, I look for blown fuses. I've had my Mega open before (installing TOS 1.4) so that helped. I unscrewed the cover, unplugged the battery, untwisted the metal shield, and stared at the power supply. Blown fuse! I plucked out the tiny thing and zoomed off to Radio Shack. It's a fast-acting 2 Amp fuse, Cat. No. 270-1244.

I get home, plug in a new one, reconnect the Mega, and turn on the switch. NOTHING. With the ``impending doom'' feeling I dig my way back inside the unit, and as expected, the fuse is blown again.

It's time to get technical now. Fortunately, I've had some experience. To rule out the computer, I unplug the power supply from the mega, and physically remove it from the system. I install another fuse, and plug it in separately. By the way, the Mega's switching supply has the power switch and the AC plug incorporated, so when it's removed from the box you still have these. I plug it in, turn it on, and poof! The fuse goes again.

Once again, experience helped. Now I knew the problem was in the power supply itself. In power supplies, one of the things that seems to go most often is the rectifier diodes. The Mega's switching supply feeds the AC line to a diode bridge directly, for full-wave rectification. With a meter, I started testing the bridge (one unit with four leads) and sure enough, one of the AC lines is shorted directly to the + output line!

Well, I'm using the Mega now. I made another trip to the Shack and put in a nice big replacement bridge. This part is labeled DB1 on the power supply PCB, and the part itself is a small black cylinder labeled `W10M' in tiny white letters. The one I replaced it with is a much beefier model, which handles 400 PIV at 4 Amps. When in doubt, overestimate.

I'm not saying that all suspicious deaths of STs with switching supplies will be caused by this part, but it'd be a good place to start looking. With a little bit of careful checking and soldering, you can save a lot of waiting and $$$!

This sounds like a slick little device, anyone know any more about it?
Or ST ethernet products in general? I remember talking to Mike Schmal
at Atari about an official Atari ethernet product a year or so ago, but
I haven't heard anything about it since.

I know there are a few ethernet products available now. It may be a good
idea to come up with an ST equivalent of the PC Packet Driver interface.
I certainly don't expect that all these boards are programmed the same way.

> Actually, I think he meant 60 seconds. The actual number is 90 seconds.

Well my computer does wait LESS than 10 seconds (haven't cared to time it yet),
and then continues booting without me having to touch the keyboard...
Now, if it waits the 90/60 seconds after "sensing" that there is a harddrive
attached, that's something I don't know...

I was told by a friend with an STe that the delay was for the harddrive,
So I mentioned it...

Oh, I'm glad we are hearing from Atari again! (Someone AT Atari I mean!)

Unfortunately, the solution you describe seems to preclude using
configurable software solutions such as duck31 that others have
devised. Is there any way to disable the 90 second delay, or has that
been made the official MINIMUM time for booting an unattended machine,
regardless of how fast your hard disk spins up? Will a bootable
floppy allow one to bypass the delay?

TOS won't write the last two clusters of a disk---thinks they are
always in use. It can read them however. This was a bug in TOS 1.0
that has been preserved for compatibility. However, that does not
imply that the disk format is incompatible. As far as I know, disks
formatted by the TOS 1.4 desktop formatter are completely compatible
with IBM. It's just that TOS 1.4 can't fill them completely.

>This sounds like a slick little device, anyone know any more about it?

The Xircom comes in two flavors, thick and thin ethernet. Since the original IBM PC Standard (which everyone, or course, blindly follows...) does not allow input from the parallel port, they had to use the printer status lines, like READY, PAPER OUT, etc.. (I don't have documentation in front of me). I'm not sure whether or not you can input thru the data lines of the parallel port with the ST, but this device doesn't do it anyway. I don't see any reason it wouldn't work on an ST, if they had ST driver software for it. Considering the ST market, I'd be amazed if they had one.

734. Publishing Partner printer font editor PEDIT--anyone got docs???

Newsgroup: comp.sys.atari.st
Date: 1990-07-13 16:26:54 UTC
From: scoile@gmuvax2.gmu.edu
Message-ID: <1830@gmuvax2.gmu.edu>
Source record: 239749

Does anyone out there have the program PEDIT, which allows the editing of Publishing Partner printer fonts? I have a copy, and it didn't come with docs (because, as the author says himself, he was too lazy to do 'em), and I can't get it to work! Does ANYONE have ANY sort of documentation for this program??? I would love to be able to make my own fonts...*sigh*...

Thanks in advance.
Please reply to SCOILE@GMUVAX.GMU.EDU or SCOILE@GMUVAX.BITNET

735. Union Demo, Carebears, etc.

Newsgroup: comp.sys.atari.st
Date: 1990-07-13 16:33:25 UTC
From: bill@mwca.UUCP
Message-ID: <1661@mwca.UUCP>
Source record: 239750

Well, I got copies of the Union and Carebears demoes (thanks, Dan!), and to my utter horror discovered that they are 50 Hz, and my Video Key doesn't tolerate this too well. Are there any measures I can take to make these demos viewable? If I crank on the vertical hold I can stop the rolling but the picture is shifted such that 30% of the screen is lost to the right, and full-screen stuff looks like utter garbage. Any suggestions?

On a related note, I've got a multiscan available to me - can someone mail me the pinouts to make a cable? I suspect this may alleviate the 50Hz problem...

736. My laser C problems are (almost) over!

Newsgroup: comp.sys.atari.st
Date: 1990-07-13 18:10:29 UTC
From: n8742883@unicorn.WWU.EDU
Message-ID: <1217@unicorn.WWU.EDU>
Source record: 239751

Thanks to everyone (all 25+ of you!) who answered my question about C parameters and function calls. Everyone said basically the same thing on how to change the structure of the functions to get everything working! I've been away from my ST for a bit, and will change my code this weekend and watch it run.

I have (sigh!) one more question specifically pertaining to Laser C. Some of the programs I have written check for an EOF value. I know that EOF is defined by Laser C as having a integer value of -1, but the beginning programs by K & R need to have an EOF value entered from the keyboard. What key sequence(s) in Laser C are needed to send a EOF to the program? Control-Z send out an EOF value, but also shells out of the program before anything else can be done. Control-C shells out completley, and Control-Delete interrupts the program.

I have tried all possible alt/shift/control sequences on the keyboard; is there a key sequence to send the EOF character to a program?

Respecfully,

Perry Pederson n8742883@unicorn.WWU.EDU

Perry Pederson asks:

> First question: How does one pass variables to a function in
>Laser C, and how do you declare that the function will return a
>certain type?

> I have tried to 'mimic' their
>example of 'older' versions of C programming by declaring the
>variables under the function declaration and removed the beginning
>'int', thus reading:

>/* getline; read a line into s, return length */

>getline(s, lim)
>char s[], int lim;
>{
> etc. etc. etc.
>}

Your example should read as follows:

```
getline(s, lim)
char s;
int lim;
{

stuff here

}
```

The problem with your example is that you have a comma following
the definition of s[], not a semi-colon. That ain't Laser C's
fault, that's the C language--you canna do that, lad. <grin>

I don't know if Laser C has an ANSI upgrade--Mark Williams has
been promising one for a while, but so far has pooped out on
actually producing it....

On a related note, I've found that a lot of games from acros the pond
don't work with my Atari monitor (SC1224 or whatever), but DO work on
other peoples' monitors (also SC1224 or whatevers). Mine is different
in that it's vintage 1986; an "old style" monitor. When running some
games, the screen rolls horrendously. (Bill's vertical hold fix works
on mine too, but you should see the desktop after you diddle with your
monitor that way!)

Anybody know what it is that these hackers are doing that mucks up
the screen? (Examples of programs that do not work: Afterburner,
Blood Money)

I remember this occasionally happening with my SC1224 on the old Rex demo. I figure they were probably trying to up the vertical resolution or something. (I'd achieved the same in my 8-bit Atari days by messing with the display list. Try to draw too many scanlines, instead of leaving X number black at the top & bottom of the screen, and the picture rolls.)

Rex demo also scrolls colors across the overscan region, so they must at the very least be messing with the display enable signal. (By toggling the screen between two scan rates. Probably 50 & 60hz.)

I'm going to have to try Afterburner again, I don't remember it working on my system either. Oh well.

From: depeche@quiche.cs.mcgill.ca
Message-ID: <3689@calvin.cs.mcgill.ca>
Source record: 239759

I think every one of you should do this right now:

1. go into your auto folder

2. run each program, and count how many of them are by charles f. johnson

3. Multiply that number by an appropriate dollar value

4. send him a check for that amount.

I just realized I had THREE of them, and don't know how long I have been
using them, or how I could live without them. When I finally realized he
wrote them all, I felt really guilty!! (The check's in the mail).

that's all I had to say.

743. Lattice C/Laser C Help!

Newsgroup: comp.sys.atari.st
Date: 1990-07-13 23:55:17 UTC
From: vanleeuw@udcps3.cps.udayton.edu
Message-ID: <1990Jul13.235517.1011@udcps3.cps.udayton.edu>
Source record: 239760

I need help! I attempted to use Laser C on my ST, but whenever I went to change the environment settings, I would bomb out. I just got Lattice C Version 5 (from HiSoft), and the same problem happens. I am using a Mega 2, TOS 1.4, and an ICD FaST 30MB hard drive. I have tried removing all desk accessories and AUTO folder programs, with no success. I haven't tried it with Lattice C as of yet, but I believe that I ran Laser C off of floppies, it ran fine. Please reply via mail. Thanks!!!

744. Atari ST <-> pbmplus conversion programs

Newsgroup: comp.sys.atari.st
Date: 1990-07-14 02:39:05 UTC
From: seb3@GTE.COM
Message-ID: <9455@bunny.GTE.COM>
Source record: 239770

In case anyone is interested, I've just submitted the following programs to comp.sources.misc. They convert between two Atari image file formats and Jef Poskanzer's pbmplus format:

pi1toppm.c -- Reads low-resolution Degas and writes ppm
ppmtopi1.c -- Reads ppm and writes Low-resolution Degas
spctoppm.c -- Reads compressed Spectrum 512 and writes ppm
sputoppm.c -- Reads uncompressed Spectrum 512 and writes ppm
ppmtospu.c -- Reads ppm and writes uncompressed Spectrum 512

I wrote these originally on an Amiga (don't shoot!). They should compile just fine on any Un*x platform. I haven't used C on the ST for a while, but I imagine they should compile easily enough.

If you are unfamiliar with pbmplus, it is a wonderful graphics manipulation package, written by Jef Poskanzer, which, in addition to being able to read and write many different image formats, can perform many useful manipulations such as scaling, rotation, etc. For more information on pbmplus, check the frequently-asked questions article in comp.graphics.

Mike,

Well, doing that wasn't probably wasn't the smartest thing you could do.
Auto-parking mechanisms, regardless of their manufacturer, do not respond well
to forced parking. Where I work, that is one of the ways that we have seen
that have a shot of crashing the mechinism. We even saw one once that
had the head drug across the media when parking was forced. My advise,
don't do it again unless your hard drive is meaningless to you.

Source record: 239771
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.8bit

The Atari Archive at the University of Michigan has grown tired of being called "terminator.cc.umich.edu" and shall now be refered to as "atari.archive.umich.edu". Since certain negative connotations have come to be associated with the name "terminator", we decided that a new name was necessary to improve our self-esteem.

The archive is still at "terminator" for now, but as we get more funding and more machines we will move the archive. The alias atari.archive.umich.edu will then point to the new machine. So, for uniterrupted access to the Atari Archive at the University of Michigan, please direct all mail and ftp traffic to atari.archive.umich.edu.

That is all.

Yes, the multisync (I suspect that's what you meant?) should work perfectly with the demos, I don't think the Video Key was ever designed to work with anything other than a 60hz signal.. 50hz causes alot of problems in the U.S. Most monitors work just fine, but some roll, and some are shifted over about 2 inches.. sounds like the video key is the worst of both worlds!

I do not have the pinouts for a multisync, but it should be easy enough to hack one up.. on a similar note, there is a company, talon microsystems or some similar name, that makes a box to hook up to a multisync, but it was an ungodly $80!

All these drastic actions, just for some demos... =^)

Sounds like "loose cable" to me:

the mouse sends four signals to the keyboard processor; two each for
horizontal and vertical movement.
Whether the cursor is to be moved left or right is determined by which
of the signals appears first.

If one wire has no contact to the connector, the other one will appear
as "first" to the keyboard processor all the time: the cursor moves in
one direction only.

Check all connections and plugs (inside the mouse and connector to ST)
for conection. If necessary, replace connectors or cables.

G'day,

I am sorry to reply to this info free thread :-(but _this_ Amiga fan reads the Atari newsgroup because I'm interested in the Atari machines etc. I happen to be a computer enthusiast (sort of) that wants to know the facts about all sorts of machines.

I'm sorry for all of us that there's so much harping by some Amigaists in this group. In our defence I will say that there has been some very good information posted to this group by some employees of CBM as well as by some of us reasonable Amiga fans. :-)

Perhaps a question to redirect this discussion away from its confront-ational trend? { Can't hurt to try, eh? :-) }. Can someone please tell me about the AppleTalk feature of the TT?

{ In case I am misunderstood I like _my_ computer but not the fighting that is going on in this newsgroup at the moment b/w Amigans VS rest of the group. I don't recall Atari-ists doing that in any Amiga news group. }

I suppose there can be useful discussion of cross computer features... such as the hard area of trying to port programs/code b/w platforms or how to use data for programs that run on each machine (eg. PageStream) but it never seems to be done. :-(

Peace.

yours truly,
Lou Cavallo.

Yes, there is B-GIF from the public domain. It will run on color systems only, but as it can also convert to Spectrum 512 (.SPU and .SPC) pictures, quite STunning.

Hope this helps,

Techno

754. 50hz/60hz

Newsgroup: comp.sys.atari.st
Date: 1990-07-14 20:57:19 UTC
From: dhollis@shiloh.UUCP
Message-ID: <210@shiloh.UUCP>
Source record: 239777

Ok, I'll try to clear this up....

The problem with 50hz and 60hz, is that power supplies in the USA and Europe are different. Where the US uses 60hz cycle power, Europe uses 50hz cycle power. The ST can operate in both modes regardless of what power supply you are on (50hz/60hz) but running your ST in the mode that corresponds with your power supply makes it alot easier on your system. So, there is a little toggle in a hardware register which changes between these two modes. The address is $ff820a, you toggle bit #1 ON for 50hz, and OFF for 50hz (bit #1, not bit #0).. this sets the scan rate for the monitor as well! The vertical blank timing gets altered to match the new screen rate, so programs tied to the vertical blank will get messed up..

This is a good way to tell if a program is an import or not, because most (not all!) imports set the screen rate.. I wish they would leave the scan rate alone, and put a little sticker on the software package that says 'this program was imported' rather than fiddling with the scan rate.. =(If you know your assembly code, you *can* sometimes hack into some of the older european programs and clean the scan rate changes out, but with the newer stuff, it is usually coded/encrypted, and hacking encrypted code is no fun at all!

BTW, in Blood money, there _is_ a key you can hit to change scan rates, it's F8/F9 on the main screen (not when it's booting, but when it's finished booting and asks for disk 2).. it's an undocumented 'feature'.. you want something interesting, try hitting F10 while playing the game!

Hope that cleared things up!!

755. Re: Union Demo, Carebears, etc.

Newsgroup: comp.sys.atari.st

From: gt1448b@prism.gatech.EDU
Message-ID: <11380@hydra.gatech.EDU>
Source record: 239774

Somebody recently posted a question concerning the CP/M emulator
and a hard drive. This is what I know:
The CP/M-Z80 emulator is capable of accessing your hard drive,
but it is limited to 4 Mb partitions. If your partition is greater
than 4 Mb, you will get a warning that it has been truncated to 4 Mb
when you try to access it. If you use TOSDIR to list the files on
your hard drive, it will list the files in the currently active TOS
folder for that partition.
You could set up a 4 Mb (or less) partition and use it strictly
for CP/M. You would have to develop a routine like INIDIR to convert
it to a CP/M partition (INIDIR is coded for a 360K single sided drive
only). You can also install a RAM disk and use it. I used the SS RAM
disk with Turtle, then used INIDIR to change it to a CP/M RAM disk.
This worked out quite well.

757. Weird Problem with I/O Red. (Tech)

Newsgroup: comp.sys.atari.st
Date: 1990-07-15 05:16:39 UTC
From: bkr@mcshh.hanse.de
Message-ID: <7799@mcshh.hanse.de>
Source record: 239772

Hello Netland !

I'm having trouble with GEMDOS I/O redirection and the internal memory
problem (Tos 1.4, Poolfix3 installed):

I have a little linkable shell module which I use with many of my programs
to call other programs with redirections in a shell-independent way.
The code looks somekind like this (input red.):

```
sav=Fdup(0);
fh=Fopen(new_in,0);
Fforce(0,fh);
Pexec(...);
Fforce(0,sav); Do I have to Fclose(0) before ???
Fclose(fh);
... Do I have to Fclose(sav) here ??? May I ???
```

This works wonderful, until I call the program doing the redirections
from any shell with an input redirection on itself. Everything still
works fine until I leave my CLI - getting the well known message
'Out of internal memory... Use FOLDR100 to get more'
(Didn't matter which CLI I tried - gulam, gp, command...)
Using FOLDR100 up to 900 folders didn't change anything.

Tracing my code, I encountered a return value of -65 (internal error)
in my Fclose() call. I first removed the Fforce(0,sav) but it didn't
mattter. Then I took a closer look at the docs, noticing that Fdup
does only work on handle 0-5. Realizing that Fdup probably takes the
associated physical handles from BASPAG->p_stdfh I found out, that
the following piece of code is a way to get the 'Out of...' message
immediately - just compile and type 'thisprog <anyfile' from your cli:

- all examples are in Turbo C, I'm working with TOS

```
#include <tos.h>

main(void)
{
return Fdup(0);
}
```

I had to get my code to work and added these:

```
/ pretend successful exec
#define Fdup(x) (_BasPag->p_stdfh[x]) /
#define Fforce(x,y) (_BasPag->p_stdfh[x]=y,0)
```

It worked, giving me no more 'System Halted' messages but still left me
alone with my 'Internal Error' return codes.

Could anyone please describe a real clean way of doing redirection when
it is possible that the standard handles are already redirected ?
What about re-forcing stdhandles and closing them afterwards ?

Perhaps some Atari Official can give some statements ?
[ERROR -65]
[Fdup'ing an already Fdup'ed handle]

Any help is strongly appreciated,

Bjoern

>Blood Money)

Who knows what they're doing, but I can tell you for sure that some things will not work on some monitors. The difference between 50Hz and 60Hz can sometimes be without a cure. There are several different 50/60 switchers available in the public domain. I've found one that works great, and is only about 500 bytes long. If anyone is interested, let me know. This will help with a lot of the problems, but not all. Where I work, we've fixed about 5 or so games from Europe with it, but some, like Blood Money, just will not work on some of the 1224's out there. If anyone is interested in a program like this, let me know and I'll post it to comp.binaries.atari.st.

Message-ID: <3845@bdt.UUCP>
Source record: 239784

A good magazine to look in is Keyboard or MIX and look for the ad called MIX bookshelf. The number is a 800 -toll free phone number.

Another good place to call is MIDI WORLD NETWORK (213) 841-0347 (2400 baud ... they have a MIDI developer's forem that might be able to give you some more insight). Also another good place to call is CODEHEAD software (213) 461-2095 (2400 baud). The above locations should provide you with many ideas to takle your problem. Another book you might want to take a look at is introduction to MIDI PROGRAMMING (ATARI ST) by Abacus Software.

This overscan technique is crud. It depends heavily on undocumented side effects in the GLUE chip and thus will not work on all ST's and definately not on an STE. We have had all sorts of problems with programs abusing undocumented memory locations so please don't start hardware weirdness too.

>And games which have good graphics (ie large, eye-catching sprites) are
>easier to sell in a store. Kids tends to pick a colorful game rather
>than the dull and gloomy equivalent.

Any dopey kid who buys the crap because it's in a glossy box and has pretty pictures deserves to get ripped off. Any game player will tell you it's playability that matters. Nethack being a fine example.

At the moment the games scene is very sick. It's poor quality and big profits all the way and I wish it would change.

It *WOULD* be nice if you'd put this boot sector in comp.binaries.atari.st,
so the Atari community would greatly benefit from it. Speaking for myself,
I would be happy to use it - and I suspect many others would too.

I'd write the darn thing myself, if only I knew how to poll a HD on readiness.
Does anyone out there want to tell me all about that? Thanx.

language version of TOS, contact your..."

I have TOS 1.2, should be US (or GB) version, no scandinavian patches.
Are there really different versions of WordUp for say German and US
versions ?

I am only asking this here because:

a) My local dealer lives in U.S.A and I live in Finland
b) I wouldn't want to spend my nights talking with technical
support (time difference is about 8 hrs.)
c) I don't want to wait for weeks before getting reply to my
letter.
d) this is where all the good stuff usually comes up anyway

Thanks in advance,

Markku M{enp{{ (vehka.uta.fi)

P.S. Does Neocept have a FAX ?

Yes it is possible. If you have a program to switch to 50 line mode (i remember a posting of two files L25.asm and L50.asm some time ago), GNU-Emacs will recognize this. It will even recognize any other screen size (<= 300 rows and <= 300 columns) and display them correctly (for example if you use BigScreen, the low-resolution of the ST or a larger monitor).

Well there is a PD program called SEDT available in one of the volumes on
various ftp sites. This is similar to EDT in that the keypad is mapped the
same. But there are differences. I use it on occasion and it works fairly well.
If you are using lots of the more advanced EDT functions (define key, etc.) I
don't beleive they are in SEDT but there are equivalent commands.

Congratulations to Dave Baggett and all the yes voters. BTW, I missed seeing my yes on the vote counts Dave... We now have comp.sys.atari.st.tech . Lets start posting those thorny questions (and knowledgeable answers 8-) about how your ST works and programs here. For my contribution, if I get enough reponse, I will post my docs on how to upgrade floppy drives here. Ask for either the one to upgrade your SSDD drive to DSDD and/or for the upgrade to DSHD from whatever - if hase, AKA Hartmut Semken, doesn't wish to post on his HD upgrade himself! I also have kept many of the interesting (to me) technical postings on c.s.a.s since about Dec '89 and could repost them if the authors cannot or will not answer the same questions again.

thanks for reading,

You're in luck.

There's an editor called 'SEDT' that runs on the Atari ST and the
IBM PC (VAXen too, but...) that is very similar to EDT (the keypad
is identical). The command language has more features than EDT does,
and there's no line mode (but who wants that?).

You can find it in the Atari archive at UMich (nee Terminator) under
'STEDT'.

> Subject line asks it all....

It works with both rez's on the FM's. You do lose significant picture quality, as you would espect.

As long as we're bringing up TV interfaces, my old 520 (pre-FM TOS 1.0) worked really well with my color TV's, my new 520 STFM (TOS 1.2) gets a lot of video noise, which is related both to the grounding of the cable (when I hold it or rearrange it the signal quality varies from horrendous (?) to acceptable) and a lot of noise from the ST itself (when I turn it on TV reception is noticeably deteriorated on the TV in the next room. Is this a problem in general with FM's or did I just get lucky?

>since I threw out our documentation.

Yes, but who would want to do that ? I bought an ST to get software,
even though I had a technically superior (and 20 times more expensive,
originally) CP/M-68k machine.. . The only reasonable thing I can think of,
for the CP/M-68k machine, is to emulate TOS (only the `normal' bits,
not BIOS..) in order to run compilers etc.

Anyway, CP/M-68k STINKS. It does allow for disk change without reboot, but
that's about the only improvement in usability over CP/M 2.0. I can't
even write a terminal emulator, since the standard BIOS doesn't have
status info. for the serial line(s), arrrghh.

>
> Sounds like "loose cable" to me:
> ...

I have an other interpretation of this problem (based on 25 1040st in my lab
and about half a dozen or more sick mouse ...) The culprit are the encoders.
The heavy ball drive two wheels that pass through optical 'gates'. They
each produce two signals that should be dephased by 90 degree. If this
change too much, then you get your stange observed effects.

Cure : First clean every thing carefully. Dust on the axes or the optical
path can cause the phase error.

Second, but this is an other story : with time, i have noticed that
the optical system performance are changing and this must be readjusted.
In principle, you find two screews (with red paint ?) at one extremity
of the optical part, and they should be used to adjust the phase. Now
for some reasons, the light emiters and receivers are solidly soldered
on the printed board, and the screews have no effect any more.
The solution we have found is this: unsolder the four wires going
from the printed board to the emiter and receiver, bend them
horizontaly, solder on them thin wires that you also solder to the
printed board at the original place. They should make some thing like
a 'Z', in such a way that you can now change the phase with the screews!
Best try to look at the signals (and phase) with an oscillo !
If you need a drawing, just ask, the ptt will transmit it.

If this sounds too much, and the cleaning does'nt works, then I am
afraid that you better get a new mouse (logitech has one now for the
atari for about 60$ [in Switzwerland ...] that should be very
reliable).

Good luck ! Paul.

786. Spectre Questions & Bug Reports

Newsgroup: comp.sys.atari.st
Date: 1990-07-17 10:43:30 UTC
From: jeroen@plato.phil.ruu.nl
Message-ID: <527@accucx.cc.ruu.nl>
Source record: 239654

A friend of mine asked me to test his Spectre GCR emulator (I'm a Macintosh system manager), and I'd like Dave Small to know about a few things, and I have some questions maybe some others could answer too.

I don't know how to get in touch directly (I don't know how to get on GENIE, CompuServe etc. etc.). If anyone can give me "Gadgets by Small"'s email adress I'd be happy too.

- Spectre 2.6.5 Bug Report:
When pressing [Enter] on the numeric keypad an incorrect keycode is returned, and (worse) this key keeps repeating until another key is hit.
I think this bug should be fixed, don't you all?

- Inconvenience:
My ST has been upgraded a while ago to 2.5 Mb. Ever since I've been unhappy about the unused 0.5 Mb in my ST; some German soldering hero howerver has gotten around the "2 banks" limit (method: demultiplexing the adress lines and building some additional selection hardware - on system boot, the ST detects 2 banks of 2 Mb at first, sets the appropriate bits in the memconf system variable, and at a certain point starts clearing memory, and this clearing fails at 3 Mb due to "nonexistent adress" access which results in TOS setting phystop at 3 Mb). So anyway, now I've got a 3 Mb ST, and all applications except one use this nonstandard amount of memory: you guessed right, Spectre doesn't know of the possibility of having 3 Mb in an ST.
When in Spectre I can pretend to have a 2.5 Mb ST (which works fine), but (since MultiFinder runs so nicely in Spectre) it would of course be ideal to have it use the full amount of memory available. A programmer myself, I don't think that should be too hard for mr. Small: for me, it would mean I can run applications that require 2 Mb store more smoothly. My opinion is that Spectre should support this kind of machine configuration, since it is getting to be quite common around here (buying a Mega ST 1 and upgrading it to a Mega ST 3 is actually cheaper than buying a Mega ST 2!).

- Conversion to/from expensive Macs *WHITHOUT* using the GCR:
There actually are people (take me for example) that have an expensive Macintosh IIci at work and an ST at home. Since my Mac (and the IIcx and IIfx as well) can read MS-DOS floppies, file conversion should be possible via MS-DOS disks. I've managed to accomplish this one way only, however; for convenience I use Stuffit to archive the files, and then I write them (untranslated) to a MS-DOS disk using Apple File Exchange. After moving the archive to a Spectre MFS disk using Transverter I have no problem unpacking it.
The other way around however only produces corrupted archives. Does anyone know why this is? I've tried everything, and don't get *CLOSE* to success.

Appreciate all you answers,

Jeroen.

I'm looking for an inexpensive stationary/greeting card/
flyer generator for the ST. I have seen Print Power for the PC
and know there are others similar to it... is there anything that
will do the same job for the ST?

These SW packages typically have several border options,
a small library of clip art, and some limited font selection.
While I don'e have a need for a full desktop publishing capability,
a program to generate report cover pages, flyers etc. would be most handy.

Anyone know of such a package?

Thanks,
/john

>not on an STE. We have had all sorts of problems with programs abusing
>undocumented memory locations so please don't start hardware weirdness too.

With some minor changes of the timing it can be made working on the
STE as well. Actually, there ARE games which uses these 'features' of
the GLUE and the MMU. [I know of "Chambers of Shaolin"]

Perhaps the ST community will have to start using everything they
can to survive. In Sweden, and as I hear in Norway too, ST sales are
low, and the game sales even lower. Myself, I sell about five or six
Amigas for each ST, and perhaps 20 Amiga games per ST game.
I don't like it. I don't like Nintendo games consoles either, but
they sell good. The reality is catching up on us. If I were to make
a game -- I wouldn't even think of ST in the first place.

>>And games which have good graphics (ie large, eye-catching sprites) are
>>easier to sell in a store. Kids tends to pick a colorful game rather
>>than the dull and gloomy equivalent.
>
>Any dopey kid who buys the crap because it's in a glossy box and has pretty
>pictures deserves to get ripped off. Any game player will tell you it's
>playability that matters. Nethack being a fine example.

You forget that the people who intends to make a living on games
don't care about playability. If playability makes the game sell better,
then it's good. (Sierra On-Line is a good example; great games! If you
haven't played Hero's Quest or Conquests of Camelot yet, do it!)

How many parents (yes, they pay, mostly) would pay 300 SEK (about $50)
on NetHack? None. How many parents does pay 300 SEK for a glossy box
with a worthless game in it? Thousands.
Many games are even MORE expensive, like Midwinter and the Sierra
games. Dragons Lair and sequels cost about $90, but many parents like
the look of it. And where's the playability?

>At the moment the games scene is very sick. It's poor quality and big profits
>all the way and I wish it would change.

Miracles still happend, I've heard. We'll see... ;-)

MicroEmacs 3.10 for the ST (and possibly earlier versions) in monochrome supports a variable ($mode?) that set to DENSE will give 47-lines. Check the ST-specific documentation for the exact details.

Okay, to try this one more time...

=====previous article repeated==========================

Does anyone out there have the program PEDIT, which allows the editing of Publishing Partner printer fonts? I have a copy, and it didn't come with docs (because, as the author says himself, he was too lazy to do 'em), and I can't get it to work! Does ANYONE have ANY sort of documentation for this program??? I would love to be able to make my own fonts...*sigh*...

==

Okay, I know about the SoftLogic BBS, but I can't afford the call, so does anyone know of any anonymous FTP sites that might have the docs? Maybe someone who knows how to use is could type in the basics and send 'em to me... Please, PLEASE, SOMEbody...(whine, whine, grovel :)

795. Terminator Name Change Clarification

Newsgroup: comp.sys.atari.st
Date: 1990-07-17 22:22:40 UTC
From: dyer@math.lsa.umich.edu
Message-ID: <1990Jul17.222240.16365@math.lsa.umich.edu>
Source record: 239661
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.st.tech

Some people just can't take a joke...

The reason why terminator.cc.umich.edu got changed to atari.archive.umich.edu was technical. The babbling about "negative connotations" and "self esteem" was a joke.

In short:

The machine where the Atari Archive is located is called terminator. It was called terminator before the Atari Archive moved there and will continue to be called terminator after the Atari Archive moves away. It isn't our name. atari.archive.umich.edu is our name and whatever machine we use in the future will inherit the name. This allows us to move the archive transparently. You can use terminator.cc.umich.edu if you like, but one day it will stop working. atari.archive.umich.edu will work until the archive goes away.

Now stop sending me mail about how y'all liked terminator better!

Jon

G++ from FSF already exists, but this requiers a large memory and a Hard drive.

I have just purshased Lattice C Vsn 5 from HISOFT. In the manual it states that
the -C flag on the compiler will place it into compatibility mode with the
Lattice C++ front end. So could HISOFT be porting the C++ pre processor to the
ST ? I certainly hope so.

From: ggreenbe@rodan.acs.syr.edu
Message-ID: <3924@rodan.acs.syr.edu>
Source record: 239680

I'm posting this here because the ST world is familiar with
programs like DCSquish or Pack, which compact files while
leaving them in "running" form. Obviously, ST people
frequently know things about the Mac world (due to
Spectre)...so I was wondering if any of you know if there are
similar programs for the Mac world? If so, will they work
with Spectre (both on disks running with spectre format and
disks running under the GCR)?
Email me directly or post to the net....Thanks

I though TOS was basically CP/M-68K plus GEM and a bunch of extra functions
in the ROM I/O system (xios?).

Have you considered porting MINIX-ST to the CP/M machine?

> does not require MTCSH to be in operation for it to run.

I guess we're close enough to releasing this to give a status report:

A couple of years ago, Dale Schumacher modified UUSLAVE into
UUMASTER, then evolved it into UUMAIL, a single program that included
a simple UUCP transport mechanism and a simple user interface.
Various other folks added functionality -- Kent Schumacher wrote a
file pager, John Stanley wrote a superb reader that organized the
messages visually, and I wrote basic news software.

UUMAIL had problems, though, and because of its kitchen-sink design
and its history, it was just about impossible to figure out what was
going on inside it. And it was slow.

So Dale decided that the solution was to junk UUMAIL and build a new
mail system based on various freely available components from Un*x,
plus original tools to fill in the gaps. He asked for volunteers from
the Minnesota Atari ST (MAST) user group. Eventually it boiled down
to Dale, Tom Cook, John Stanley and me.

We've been working on this for what seems like forever. Every time we
think we're close to releasing it, we either find one more bug or
notice one little problem (docs? You mean people would want docs?).
The software runs, though, at eight or nine sites that I know of.

We have set up a mailing list for discussion among folks who are
testing it and folks who want it. If you would like to be added, send
e-mail to st-mail-request@thelake.mn.org.

The package includes:

* A uucico program based on dcp with Peter Housel's 7-packet
windowing 'G' driver. Translated into English, that means it's fast
-- the protocol does not wait for each individual packet to be ACKed
before sending the next one. Tom Cook is running it with a Telebit
T2500 and getting excellent throughput.

* Smail 2.5, modified somewhat for single-tasking systems. Most of
the functionality of smail remains -- you can resolve complicated
domain addresses, @, % and !. You can shelter unregistered systems

behind your FQDN, as Tom Cook has done:
user@your_favorite_bbs.citadel.moundst.mn.org.

* lmail as the local delivery agent, allowing for even more
flexibility in aliasing and the maintenance of mailing lists. lmail
also can deliver to pipes, which means you could write an
archive-server if you're sufficiently nuts. I wrote a mail-to-news
gateway. lmail also generates intelligent error messages and bounces
bad mail properly.

* Many original programs, including
cron, a timed-event scheduler
email, a user interface for writing messages
readmail, a user interface for reading messages
various utilities

> I would also
> be _very_ interested in any type of news package for the ST- the kludge
> system that I have been using for the past 6 months is not able to handle
> the kind of traffic that I am now handling.

Our package includes news support, but not B or C News.

I wrote an rnews program for UUMAIL that unbatched news and wrote
single files to a spool directory. It worked well but slowly -- GEMDOS
is miserably slow in creating new files on a drive that's
three-quarters full. (In my experience, all disk drives are
three-quarters full, except the ones that are completely full.)

After Tom shipped me the new mail package, I wrote a quick-and-dirty
rnews that delivered news to Unix-style mailbox files, as determined
by a file that aliases newsgroups to mailboxes. This avoids the slow
GEMDOS file-creation problem, but it unfortunately renders John
Stanley's excellent UUREADER for UUMAIL useless. As a result, John is
still using the old rnews with the mail new package. This is OK,
since his dynasoft.UUCP is a leaf node.

Dale heavily rewrote and improved rnews. I added a couple of more
features, he fixed them :-), and the result is a very fast news
processor that delivers local copies, forwards batches to upstream
and downstream sites, and understands complicated sys file entries
with '!' negation and ".all" or ".*". The program does not yet
handle compression.

Dale wrote a sendbatch utility to call uux remote!rnews. I wrote a
postnews program that seems to be working well. I'm using it now.

The weak spot is the newsreader -- there isn't one. I'm using a shell
script to call readmail -f<newsgroup> for about 35 newsgroups. Since
readmail doesn't have any idea what the highest-message-read might
have been, this is not optimal.

This whole mail/news package is not 100 percent ready, the programs are not 100 percent reliable, and the documentation is not 100 percent accurate (or even finished). It will never be bug-free, since TOS has internal problems and these programs hammer the daylights out of TOS. I still get error 65 (TOS internal error) and error 35 (out of file handles) occasionally while sending mail.

Nevertheless, anybody who seriously wants to set up a UUCP mail/news system can ask to be put on the discussion list in the hopes that we'll eventually mail out some software. Again, the address is:

I used hi50.tos then tried all the following with no luck:

me -l50 <file>
me -l 50 <file>
me l50 <file>
me l 50 <file>
me -l <file>
me l <file>

So, how can I do it??????

'mg' (micro gnu) emacs works in 50 line mode, but I would like to
use 'me' because it is integrated with the compiler.

Thanks in Advance
Joe Gilray

818. Full UUCP implementation for the ST?

Newsgroup: comp.sys.atari.st

Subject: 1040ST for sale
Newsgroups: comp.sys.atari.st
Keywords: 1040ST,for sale

** FOR SALE **

: 1040 ST, purchased new in January, 1988

: Works flawlessly!

: Whisper-quiet, Mitsumi internal double-sided drive reads and
writes to 85 tracks, 11 sectors, if desired!

: Original mouse replaced in Summer, 1988 -- New one works perfectly!

: Original keyboard replaced in Summer 1989, because of defective
mouse port -- No more problems!

: All original packaging included!

: All cables included!

: $450, or best offer!

: Leave message here, call me at 415-751-3693 evenings, or e-mail at
ekrimen@wet.UUCP

820. Power Supply spec's needed for BeaST FD Cub Floppy

Newsgroup: comp.sys.atari.st
Date: 1990-07-19 03:36:04 UTC
From: nut@wet.UUCP
Message-ID: <1350@wet.UUCP>
Source record: 239691

A friend-of-a-friend just bought a used 520ST system, which included a BeaST Systems DS floppy drive (external). The power supply was not included with the system, and the former owner doesn't know what happened to it. The manual says that the user "should go to Radio Shack" for the replacement, but what voltage should the PS be set to? What kind of current does a DS floppy draw? I am thinking 5V, since that's what PC floppy drives use. Mail would be appreciated, as I am going on vacation for the next 1.5 weeks and probably will miss replies posted to the net.

Thanks!

821. LaTeX on Atari-ST 1040

Newsgroup: comp.sys.atari.st
Date: 1990-07-19 07:04:23 UTC
From: uttwkt@utrcu1.UUCP
Message-ID: <299@utrcu1.UUCP>
Source record: 239692

Hallo,

I am trying to install LaTeX on my Atari 1040 ST. I have the LaTeX-files
from the mailserver in Utrecht. There are, however, still some questions
remaining:
1) How do I change the environmentvariables for LaTeX, such as
TEXINPUTS, TEXFONTS, etc.?
2) Where do I get a printerdriver for my Epson LQ-500 24 pins printer?

If you could answer (one of) these questions, please send me some mail.
You can send it to uttwkt@utrcu1.UUCP or to hvdberg@math.utwente.nl
Thanks!!

In Start magazine a while back there was an Australian program that is a sample editor for the EPS for the ST computer ... you may want to call or write to Start magazine's Music/Midi Editor Jim Perry. Also another good place to call is Ensoniq ... they may have a few suggestions. Also sound designer from Steinberg Jones should support the EPS sampler.

I have the feeling that little incompatibilities will continue to be
discovered and fixed in Quick ST and Turbo ST until they perform not
much better than TOS. Then we'll know why Atari did it that way in the
first place. No flames please. It's a nice day and I'm just musing.

>I though TOS was basically CP/M-68K plus GEM and a bunch of extra functions
>in the ROM I/O system (xios?).

Yes, as far as I can see. The emulation of TOS on a CP/M-68k machine would mainly consist of remapping the traps (I'd probably have to redo some arguments - trap numbers etc) as the functionality is there. Also, all the things that you *can't* do on CP/M-68k would have to be caught.. .

>Have you considered porting MINIX-ST to the CP/M machine?

Yes, but I don't have the time. The only problem is that I can't (easily) get to the I/O system, since it's tied to a Z80 computer. The machine is basically a HUGE Z80 computer with a 68000 board tagged on top, communicating through shared memory (the machine is a SORD M68). It would be fun though, although my enthusiasm for the machine slumped somewhat when my experimental CP/M 80 system zeroed the disk block containing the directory on my working disk..... (those were the days...).

829. DCDESKTOP, GDOS, G+PLUS, WORDUP

Newsgroup: comp.sys.atari.st
Date: 1990-07-19 12:12:19 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <3934@rodan.acs.syr.edu>
Source record: 239697

I finally got my ST back and tried WordUp3.0. Unfortunately, although it is supposed to do things differently from the earlier versions wrt GDOS, you still need to use GDOS. I say unfortunately because when using DCDESKTOP and GDOS, the former does not seem to work...Is this a documented bug? or even a bug at all? While we're on this subject...does G+PLUS correct this situation, i.e. allow one to use GDOS fonts with DCDESKTOP?
Post to the net or email me directly.
Thanks very much.
--Gerry
ggreenbe@rodan.acs.syr.edu
maxg@suvm (bitnet)
PS When booting with GDOS (which was installed by WordUp Instal Prg) it seems as if DCDESKTOP is loading, but when the desktop appears, clearly it hasn't loaded. I changed GDOS.PRG to GDOS.PR and rebooted...and everything worked fine.
One more thing...for those of you about to instal WordUp, I had to get rid of all my auto programs before the instal program would instal wordup (cf. the wordup manual).

In article <1213@unicorn.WWU.EDU> n8742883@unicorn.WWU.EDU (Perry Pederson) writes:
>
>int getline(char s[], int lim)
>{

Your array of char will have been pre-defined in some other part of the
code by:- char string[strint_length]; so at this point you will be
responding to a fn call of getline(string, string_limit);
This means you need a "pointer to a char" and not an array in the fn
definition which should be:-

int getline(s,lim)
char *s;
int lim
{

These are interchangeable at reference time but not at definition time
so the remainder of your code can remain the same ... except

>getline(s, lim)
>char s[], int lim;
>{

This would not work as described before but in terms of C programming
is a simple error. char a, b, c; is a single statement. If you
tried char a, int, b; it would try to create a char variable called int
if it did not get confused. To achieve your end you need two statements
as in char s[]; int lim;

I hope this has helped you to understand why your compiler complained.

John

833. TIFF's on the ST

Newsgroup: comp.sys.atari.st
Date: 1990-07-19 15:19:53 UTC
From: whitten@kuhub.cc.ukans.edu
Message-ID: <24985.26a5894a@kuhub.cc.ukans.edu>
Source record: 239686

Has anyone done anything with TIFF format files on the ST? We have a flatbed scanner at the comp center here, and it makes nice gray scale scans, storing them in TIFF format, which I would like to be able to use on my 1040.

I found some info on TIFF and wrote a very simple viewer, but the TIFF files are generally much bigger than I can display, and with only 7 luminances, I'm losing around half of the gray scale data.

Maybe some sort of conversion to Spectrum would be nice, but I imagine this would be no trivial trick.

Thanks,
Chris

Excerpt from Z*NET

==========
FIRST IMPRESSIONS
OF THE "TT" IN CANADA
==========
(C) 1990 by Darek Mihocka, June 4, 1990.

Well, today was the day Atari Canada made it's big debut of the TT at a downtown Toronto hotel. Free food too. You'll probably be hearing a lot about it in the next few days (the TT, not the food) and it'll be interesting to see how soon the promises start getting broken. As expected, the machine is not available yet, and is supposed to ship later this year.

As of today, TT's are available to developers in Canada, and dealers can expect a few for demo purposes by the end of August, with real shipments starting in fourth quarter. The press release states "The Atari TT is scheduled for Canada-wide release in fall of 1990". The invitation talked about a "North American" debut, so I don't know what that means for the U.S. market. Probably 1993.

The retail price is $3995.00 Canadian, (that's about $3395.00 U.S). That includes 2Meg of RAM and a 40 meg hard drive. Add from $200 to $1000 for a monitor, depending on which one you get. The floppy disk drive is still IBM comptible, now supporting the 1.44M format.

The machine supports 6 screen resolutions, including the original 3 from the ST, plus a 1280x960 Moniterm mode, a 640x480 16 color VGA mode, and a 256 color 320x480 mode. The color monitor being used at the time, an Atari TTC30 or something was capable of supporting everything but the Moniterm mode. The desktop in VGA mode looked quite good, comparable to a Mac II desktop or a Windows desktop on a VGA monitor. The display was crisp and free of any interference. The TT has the 4096 color palette of the STE, as well as the 8-bit stereo sound, making it a machine ready for multimedia applications.

The TOS running in this machine was still TOS 3.0, 03/01/90 version. The real TOS for the TT is supposed to be 2.0, and it's supposed to be a lot faster than 3.0. I ran Quick Index on the TT just to see the kind of performance I'd get. With the cache on, the CPU numbers are between about 350% to 500%, and with the cache off, about 30% slower. What this means is that in terms of raw processing speed, the TT can run 68000 code about 3, 4 or 5 times faster than an 8MHz ST or STE. I tried some sample software which I had earlier timed on my STE, and found the increase to be consistently about a factor of 3.

All the Atari reps were emphasizing the speed. Calamus was being displayed, and the TT flyer and press release were both riddled with references to DynaCADD, and a 6 page DynaCADD brochure was included with the press release. The explanation given was that Atari wants to demonstrate that the machine is a full blown CAD workstation, and can run existing ST CAD packages. Once software like Calamus and DynaCADD is recompiled for the 68030, it will run even faster.

All of the documentation presented was created with Calamus, and the press release mentions that Calamus running on the TT prints three times faster than any other package. It doesn't mention which other packages, but goes on to say that DynaCADD running on the TT is 2 to 10 times faster than Autocad running on a 386 based machine.

Atari is also working with an unnamed third party to develop a software PC emulator that runs at the speed of an AT. And I'm sure another unnamed third party is busy on a Mac II emulator.

The TT also comes with an Appletalk interface (gee, I wonder why!), MIDI ports, VME slot, 2 serial ports expandable to 4 (hey sysops, imagine the possibilites!), and SCSI and ACSI. The machine is certainly set up to communicate with the rest of the world. UNIX, X Windows, and Ethernet support are listed in the "Future Support" category of the spec sheet. Hopefully this isn't being handled by the same department that was responsible for getting the STacy and STE to US markets last year.

The thing that I found quite odd with the TT is that with all the nifty hardware built in, this machine does NOT have a blitter chip. The last thing I would have expected in a machine that's being presented as a powerful graphics workstation is that all graphics operations are being performed by software, and by TOS 3.0 of all things. This TOS, I'm told, is almost identical to the TOS 1.6 currently installed in STEs, which as we all know, is almost the same thing as TOS 1.4, just slightly faster. TOS 2.0 is supposed to change all that and really be fast, but I seriously doubt that they'll whip together something by August, given that TOS has already been worked on for 5 years.

So, back to Quick Index I went and benchmarked the screen performance. Someone at the presentation had mentioned that you could load in a DynaCADD file with 10,000 objects and watch them redraw REALLY fast. Well, the numbers I got from Quick Index, for example, in medium resulotion, gave the TT a GEM index of 166% relative to the STE. That's about 180% relative to a Mega ST. So in other words, the TT, running

TOS 1.4 (or close enough to it) on a 68030 was not even twice as fast as an 8MHz 68000 with blitter support. Take away the blitter and you're slightly over 200%. However, take into account that you can drop in Jim Allen's T16 accelerator board into almost any ST, and for $300 give yourself a 50% speed boost. That cuts the lead of the TT down to about 30% at best for screen redraws, and about 200% for general CPU operations. Needless to say, I wasn't kidding last week when I said that an ST running Quick ST blows away the TT in screen performance. Text operations gave similar results, and about the only screen operation the TT was good at was VT52 scrolling. That's due to the 32-bit data bus of the 68030 compared to the 68000's 16-bit bus.

Don't forget also that there will be the usual incompatibility problems with older ST software. You think TOS 1.4 compatiblity was bad. Wait till they try running the stuff on a 68030!

So, the TT is a nifty machine, and for only $4000 you can emulate an AT and run UNIX as well. I should say "you'll be able to...". I still have bad memories of the 1450XLD and 260ST. You all remember the 260ST? The original ST, until they actually tried to put it together and realized they couldn't make TOS run on 256K. Hopefully TOS 2.0 will run on 2 meg!

But in all fairness, since this information was presented by ATARI CANADA, in Canada, and was not just another Sunnyvale stab in the dark about what they might ship in 3 years, I have faith that Atari Canada will deliver as promised. They delivered on the STE and STacy and CD-ROM, so all I can say is that I'm glad I'm not in the US.

About 6 months ago, I was wetting my pants and then some over the STE. Not so for the TT, at least not yet. It's out of the price range of most casual ST users, and as an ST compatible machine, offers less than a doubling of power for more than double the price of, say, a Mega ST 2. Sure the TT specific software written for the 68030 will be faster, but that will mean buying a whole new set of software.

I think what will probably evolve will be some sort of a 68030 upgrade for existing STs (c'mon Dave!), similar to the kind of upgrades we saw a few years ago for converting 8088 machine to 80286 machines. I've already got 3 STs and 2 monitors, I don't need more. I would much rather pay $1000 or more to upgrade my 4 meg STE to a 4 meg STE/030 instead of shelling out another $4000 for something only slightly better.

The TT will still hopefully sell well in the business market. The hardware is certainly there and at the right price. Perhaps not as fast as we'd like to believe, but the same hype existed with the 386 chip. Perhaps the TT will follow the same path as 386 machines, and a year or two from now we'll see a more affordable TT working its way into the home market replacing the then obsolete 68000 based STs.

Well, that's the way I see it anyway.

- Darek

[If I may add two comments:

1. Darek tested a machine with just 2 megs of RAM. RAM above 2 megs
on the TT operates in burst mode and operates roughly 50% faster.
It would be interesting to see a comparison of programs running in
fast and slow ram.

2. Lots of companies have not put blitters in 68030 boxes because they
don't provide much of a speed increase. Sun, HP, Apollo, and NeXT come
to mind as examples.

Now if Atari would get the TT out the door and into a local dealer's
store, I'll be happy.

-- greg]

This is the full text of a Press Release from ATARI in NEW ZEALAND
giving the MOST COMPLETE DESCRIPTION of the ATARI TT030 COMPUTER to date.
It EXPLAINS PORTS, CARDS, EXPANSION, AND ADMITS TO THE FACT THAT THE TT
WILL RUN AT 32 MHZ, not the 16 mhz that many complained of. THIS WILL NOT
FURTHER DELAY THE TT030, EXPECTED TO BE AVAILABLE WITHIN WEEKS.
Presented by Z*NET ATARI ONLINE NEWS SERVICE, the ones to trust for
detailed ATARI NEWS FIRST. NOT ARCED, about 8 screens, you NEED to read
this NOW.....

The Atari TT030 Hardware

The TT030 (Thirty-two/Thirty-two bit) is the first member of a new series of Atari computers designed as enhanced versions of the existing ST and MEGA family. The TT series maintains compatibility with the ST/MEGA architecture, but uses the Motorola 68030 microprocessor and provides enhanced graphics and sound. The TT030 is also designed to run Unix (Unix is a trademark of AT&T).

The TT030 is based on the high performance 32-bit Motorola MC68030 processor running at a 32 Mhz clock frequency. The 68030 includes on-chip data and instruction caches which can be filled from some regions of memory in bursts of double word fetches

The architecture also includes the industry standard VME bus to facilitate expansion. The system supports the latest revision (C.1) of the VME bus specification. The TT030 can accommodate one single-Eurocard (3U) A24/D 16 or A 16/D 16 slave-only VME board,

The TT series is expected to function in an environment with other TTs and even machines from different manufacturers. To facilitate connectivity, each system has an on-board port for a moderate speed LAN. If the LAN is not being used, the port can be programmed to be a standard RS232C port. Through an optional VME bus-based or SCSI-based Ethernet controller, the TT also has the capability of connecting to heterogeneous Ethernet networks. The TT030 has three additional standard RS-232C serial ports for connection to modems, display terminals, or digitizing tablets. The hardware features of the TT030 include:

- Motorola MC68030 at 32MHz
- Motorola MC68881 Floating Point Coprocessor (the coprocessor is socketed, so that it can be optionally upgraded to a MC68882)
- ST RAM: 2 Mbyte of ST-compatible dual-purpose (video/system) RAM, expandable by an add-on daughterboard containing a further 2 or 8 Mbyte of dual-purpose memory. This 64-bit wide memory appears 32 bits wide to the processor and SCSI/SCC DMA engines TT video logic has access to this memory on a time critical basis. The remaining system logic, including the processor, can access this memory in the alternate 250 nS TIME SLICES.
- TT BURST MODE RAM: provision for a daughter-board that will accept either 4 x 1 Mbyte or 4 x 4 Mbyte SIMMS, allowing another 4 Mb or 16 Mb expansion. This RAM can only be accessed by the processor, the SCSI DMA Engine, and the SCC Network DMA Engine. The 68030 can take advantage of burst-mode for filling its internal cache from this RAM.
- 4 socketed 1 Mbit ROMS, providing 512 Kbyte of ROM space.
- Internal video modes that are a superset of those in the Atari ST/STe series using an analog RGB (VGA-like) colour monitor:
pixels rows colors palette
320 200 16 4096 (STe compatible)
640 200 4 4096 (STe compatible)
640 400 2 4096 (STe superset)
320 480 256 4096
640 480 16 4096
using a high resolution ECL monochrome monitor
1280 960 black on white
- parallel I/O port, generally used for Parallel printer

output
- internal speaker, which can be disabled under software control
- 2 low-speed asynchronous serial I/O ports (one from each of two 68901 MFPS) at programmable baud rates up to 19.2 baud
- 2 high-speed asynchronous/SDLC Serial I/O ports (from a Zilog 8530 SCC). One part can be programmed to be a Local Talk compatible LAN interface with a proprietary single channel DMA controller. The other port is intended for use as an asynchronous AS-232 port with programmable split baud rates.
- battery backed-up real time clock (RTC) with 50 bytes of non-volatile RAM
- ST/MEGA compatible intelligent keyboard, with mouse and joystick ports including support for a 3 button mouse
- Atari ACSI DMA channel (for Atari Hard Disk, Laser Printer, CD-ROM, etc)
- Floppy disk controller and interface sharing the ACSI DMA channel
- Musical Instrument Digital Interface (MIDI) STe compatible DMA sound engine with programmable volume and tone control which can play back stereo 8-bit samples at rates up to 50 Khz
- Atari ST compatible cartridge port (128 Kbyte Storage)
- SCSI interface using 23-pin connector implemented with the NCR 5380 SCSI controller chip and a proprietary DMA controller
- Industry standard VME bus for expansion

When comparing the TT030 with the competition, four important features stand out:

- flicker-free, high resolution colour graphics built-in as standard
- high bus bandwidth, independent of video resolution
- excellent connectivity including four RS232 ports, MIDI, LAN, ASCI & SCSI.
- high speed burst-mode RAM, 32 Mhz CPU clock speed.

>three-quarters full, except the ones that are completely full.)

This is a known and fixed problem in TOS 1.0 and TOS 1.2 that has been discussed here repeatedly. Just like MS-DOS 2.XX, these tos versions pick a new cluster by searching from the start of the FAT, every time. When your drive is mostly full, this takes quite a while. TOS 1.4 has a next-fit algorithm instead, which starts from the last cluster it allocated.

If you are running 1.0 or 1.2, you can use FATSPEED to fix this problem. FATSPEED also accellerates finding the number of free bytes on a drive. I have been using FATSPEED for several years and it seems very reliable.

>incompatibility being addressed by either the Gemini authors or BRA?

Bill, if you have having problems with redirection, either in Gemini or
any other shell, use Quick ST 2.1G or 2.2G. The G versions do not hook into
the GEMDOS text output functions, so they do not interfere with redirection,
but they still give you a speedup in text output. Both the normal and G
versions speed up GEM the same amount. If you haven't yet upgraded to
Quick ST 2.1 or higher, do so because you are missing out a lot.

Hello everyone!

I remember seeing in some magazine a Cheat for Chaos Strikes Back.
I could never get it to work, but it was supposed to get the
Firestaff back by casting a spell and typing something about
Libarsulas (sp?) smites thy down, or something like that and killing
a dragon, then poof! The Fire Staff is supposed to be in front of your
feet. Does anyone know this cheat and how to get it to work?
Also, a while back I found a scroll that was in some strange language
and I think it started off with the word Aquatanta or something like that.
Does anyone know what this means? Thanks!!!

Take care,

Michael Rose

>Clock speed 16 Mhz - 32 Mhz
Yes, a 16MHz A3000 is available (or will be), but the currently shipping model priced closest to the TT ($3995, 2MB, 40MB HD) runs at 25. It also has a coprocessor slot for full '040 support ('030 will still handle menial i/o while '040 does number-crunching) when the chip becomes available.

>RAM 2 to 17 1 to 32 2 to 26
^^^^^^
That's 2-18, and it's on the motherboard itself. Will autoconfigure up to 1.7 GB, and even more can be added via AddMem.

>Burst Mode Yes No Yes
>ROM 512K 256K 512K
>Graphics
> Max resolution 1280 x 480 Optional 1280 x 960
> Interlaced Non-interlaced
Amiga: Max non-interlaced resolution= 640 x 480 (more w/overscan).
1280 x 800 on Moniterm or A2024 monitors.

Mac: I think 640 x 480 is pretty standard.

> Max colours 32 Colours 256 Colours
> from 4096 from 4096
Amiga: Try 4096 out of 4096.
Mac: Most often 256 out of 16 million.

> Max video RAM 1 Mb 8 Mb
^^^^^
2 MB with current chipset

>Sound Stereo Stereo Stereo

Only one?!?!

>When comparing the TT030 with the competition, four important
>features stand out:
>
> - flicker-free, high resolution colour graphics built-in as
> standard
Same on A3000. Mac capable of 32-bit color.

> - high bus bandwidth, independent of video resolution
The A3000 has a separate bus for video & sound, freeing up the bus for
other activity.

> - excellent connectivity including four RS232 ports, MIDI,
> LAN, ASCI & SCSI.

This is probably the TT's strong point.

Not trying to start a flame war; just trying to correct some
misinformation and comment on the TT's advantages/disadvantages as compared
to its competition (based on the specs you quoted for the TT, assuming they're
accurate).

IMHO, the ST line is already too far gone in the US for the TT to make any
appreciable sales. What little image Atari has in the general computer
marketplace is generally a negative one, despite the fact that they do make some decent
computers...

The Mac, although still grossly overpriced and somewhat underpowered,
has a large software/hardware base and a generally positive image in the
marketplace, and more high-end expansion options are available for it.

The Amiga 3000 and its relatives don't have too much of an image either,
but I've lately seen signs that this is changing. Things like AmigaVision,
CDTV, DCTV, Unix SYS5r4, and the Video toaster will keep its sales increasing.
Not to mention that in the past year or so, Commodore has really done a
tremendous job of getting its act together.

DOS machines: ick. Unfortunately, they're cheap and popular, and
will continue to be far into the future (ugh).

Atari really needs to push the TT's networkability and speed advantage
if they want much market penetration. They also need to implement an
educational program! Because of CBM'd ed discount, I can get a 25 MHz
3000 and multisync monitor for $3039 (and probably will, when I save up
enough cash).

842. WordUp 3.0

Newsgroup: comp.sys.atari.st
Date: 1990-07-20 00:46:00 UTC
From: david.megginson@canremote.uucp
Message-ID: <eacad8f937b026a67068@canremote.uucp>
Source record: 239699

I'm still looking for a half-decent word processor for my ST, especially since WordPerfect tried to eat my e: partition AGAIN (it hates files over 70 or 80 pages long). I'd like something reasonably programmable (not too possible, I know), but most importantly, something with decent font support. I do not need a spell-checker, although it would be nice.

THE POINT:

I (and I'm sure, many others on the net) would like to hear people's reactions to WordUp 3.0. Is it the word processor that the ST has been waiting for all these years, or another dud? I need to design and use special characters on the screen and printer, and I like multiple windows and something capable of handling a long (200-300 page) document efficiently in a single file. An easy request on ANOTHER machine named after a fruit...

For those of you who dont know this yet, A friend of mine
who has an Amiga just got some software from Germany, one if them
is an ST software emulator, It worked, but only in High Resolution
It ran just about every utility we tried, except Magic Shadow Archiver
and a few others, the program is called MEDUSA, there is supposed
to be a hardware version of the st emulator comming soon.

Yeah, I'm still stuck back in the dark ages with TOS 1.0.

I heartily recommend FATSPEED -- along with a few other programs such as
PINHEAD (or NULLFILL) and a disk cache, it helps make TOS a lot less
painful.

Even with that help, though, we found that creating new files involved
significant overhead, especially when the directories got big (sometimes
300 or 400 files) and the drive got fragmented. Unbatching large
quantities of Usenet news was taking more time than receiving it at
1200bps.

If the ST were a multitasking system it wouldn't have been such a problem,
but it's not -- and having to wait 45 minutes while the machine processes
news isn't my idea of fun.

Ditching the whole idea of "one message, one file" was just one of the
speed enhancements. We also pull an entire Usenet message into RAM before
processing it. The header is scanned using pointers and offsets; the
"Path:" line is examined and updated; the "Message-ID:" line is extracted
for comparison with a history file, and the "Newsgroups:" line is
extracted for delivery and forwarding purposes. Disk writes then take
place using single Fwrite() calls.

Dale Schumacher's most recent speed enhancement is crunching the
message-IDs to a 32-bit CRC, which allows a simple comparison of long
integers to replace a function call to strcmp() and also cuts the RAM
usage. This rnews is about as fast as it can get.

846. I want to get a SIMM upgrade for my 520ST ...

Newsgroup: comp.sys.atari.st
Date: 1990-07-20 07:42:28 UTC
From: baffoni@alcor.usc.edu
Message-ID: <10932@chaph.usc.edu>
Source record: 239816

I have just come upon some old Mac 256 simms and would like to use them to upgrade my 520ST. Does anyone out there have a SIMMable upgrade they would like to part with, or barring that, could anyone recommend a good SIMMable upgrade put out commercially. I am not worried about having to solder (my warranty is LONG gone...and I work in a PC repair shop), however I, being the lazy person I am, would like to do as little damage to my mother board as possible. Also it would help if the upgrade were constructed so that I don't need to do much hacking of the interior of my machine - I can do it if necessary, but a surgeon I am not.

Thanks Much!

-Mike

847. STe

Newsgroup: comp.sys.atari.st
Date: 1990-07-20 08:03:37 UTC
From: srs@oasis.icl.stc.co.uk
Message-ID: <542@ozz.oasis.icl.stc.co.uk>
Source record: 239825

Hi there,

Got two questions I'd like to ask all you out there:

1. If I have an STe with 2 1meg SIMMS and 2 1/4meg SIMMS, I can boot up with some software to get 2.5 meg, right? Now what would happen if I booted without the software? Would I get 0.5meg, 2meg, or would it crash?

2. A friend of mine just bought Lattice C V5, and somewhere in one of the manuals it says something about HiSoft releasing a front end C++ translator. Does anyone know if this is still true, and if so when will it be released and how much will it cost?

Reply by mail please, the news is a bit slow getting here, I'll sumarise to the net if I get enough response.

Steve - srs@icl.stc.co.uk

Well, it's a very nice program, but what do I do when I want to catalog
my 5 1/4'' disks from drive B: ? I can't select it. It's the feature
I miss in this excellent program.

From: sys131@ztivax.UUCP
Message-ID: <1351@ztivax.UUCP>
Source record: 239818

Hi folks,

I am looking for a programm that converts a text, written
with SIGNUM into TeX source Text.

My girlfriend wrote her doctorate thesis with SIGNUM (the
only cheap system with old-greek characters). Unfortunatly
the publisher, she is forced to work with doesn't accept
printed layouts and his text system is TeX !!!

I would be very happy, if somebody could help me with this
problem. (Please answer by email; since this is my first
active paticipation on the news net, I may need some further
help in getting a compressed program running ...)

Thank's for help ruediger

852. Re: TT (Who has one?)

Newsgroup: comp.sys.atari.st
Date: 1990-07-20 13:59:42 UTC
From: cmm1@cunixa.cc.columbia.edu
Message-ID: <1990Jul20.135942.13071@cunixf.cc.columbia.edu>
Source record: 239834

I wish to thank the person who posted that lengthy article concerning the TT. It is the most informative post I've seen so far on the subject.

A few comments:

1. It was interesting to note the rather healthy dose of cynicism Darek gives whenever the name of Atari is in the same sentence. I guess we can't blame him. And this guy is one of the biggest supporters of the ST line as far as I can ascertain! Hehe, I love it...

2. The chart posted by Atari NZ regarding the TT specs (reporduced below) is a bit irritating. It compares a 32mhz (I'll consider it 16mhz until someone SEES/USES a 32mhz model) TT against 16mhz models made by competitors. This is absolute bullsh*t. The Amiga 3000 is offered in a 25mhz version (Which you can buy TODAY at a lower price than those quoted for the TT) and the MacII family has a 25mhz and *40mhz* versions which you can go right out an purchase now. While the Macs may be more pricey, they are available NOW and have been for quite some time. As far as the A3000 goes, I think the quoted prices for the TT are higher when you consider that you must go out and buy an EXPENSIVE multisync monitor to handle ALL of its various display modes.

3. As Darek noted, TOS v.X.X has and seems doomed to be forever buggy. The other machines listed on the table seem to have better support for OS updates. Are you willing to buy computer X slightly cheaper now only to be hung out to dry when it comes time for user support?

4. Also, as Darek noted, if/when Dave Small produces a 030 upgrade for the ST, you could buy a NEW Mega 2 system and a $1500 030 upgrade and still save well over $1000 in the cost of the TT. Go figger...

Anyway, here is the table again for those who missed it...

Comparison of standard features

Amiga 3000 Mac IIcx Atari TT030

CPU 68030 68030 68030
FPU Yes Yes Yes
Clock speed 16 Mhz - 32 Mhz
RAM 2 to 17 1 to 32 2 to 26
Burst Mode Yes No Yes
ROM 512K 256K 512K
Graphics
Max resolution 1280 x 480 Optional 1280 x 960

Of course you're right. In fact, it wouldn't be an emulation at all
but could be a "native" operating system. However, the point of
emulating CP/M-80 was to allow people who had CP/M machines to
migrate to the Atari without discarding all of their CP/M-80
software. In fact, the emulator is nearly as fast as my 2.5 MHz
Z80 machine and screen and disk I/O is much faster. Transferring
the software is my only holdup to getting rid of the real CP/M
machine.

As an aside, I worked with Andy Mickel here at Apollo for a couple
of years -- I can see him saying that :-)

So the long waiting times befoer V2.0 is delivered is not because of this.
Am I the only one having to wait for 3 or 4 weeks now?
If so, could anyone let me know? Then I can call Heimsoeth about it.
If not, do you know why it is taking so long, and how long may it take?

Thanks,

857. Time for a New Computer: Should it be an Atari ST?

Newsgroup: comp.sys.atari.st
Date: 1990-07-20 16:20:17 UTC
From: megabyte@chinet.chi.il.us
Message-ID: <1990Jul20.162017.21823@chinet.chi.il.us>
Source record: 239820
Cross-posted to: comp.sys.atari.st,comp.os.os9,comp.sys.m6809

I'm finally about ready to give up on my Tandy Color Computer 3. While it's a fine machine, for an 8 bit machine, it seems that both Tandy and 3rd party support for it are dwindling. So, it's time for a new computer.

Several of my friends have recomended the Atari ST line as an "Upgrade" path from the CoCo 3. The reasons:

High Quality Graphics
Mouse driven, graphic interface
Ease of Use
Cost effective
Relative ease of finding software
Good sound
Good 'C' compilers available
Lot's of PD code
Can read those messy-DOS disks
Runs OS-9 (My prefered OS)

It almost sounds like the CoCo 4 Tandy never came out with. So here are my questions about the Atari ST line:

1. Cost - What do the 1040 and 520 ST systems cost? What is the used market like? Are there 3rd party disk drives, hard disks and etc for it?

2. Expandability - Does the ST have "standard" printer, RS-232 ports and other places to connect devices?

3. Monitor - Is the Atari monitors the only games in town? Should I go color or mono?

4. Software - I see LOTS of games for the ST in my local store, but few word wackers and other "user" programs. Do they exist, but just not retail?

5. OS-9 for the ST - What is the cost? Is there a windowing version of OS-9 for the ST? or it is strictly a "generic" implimentation?

6. Anything you might want to tell me as a potential ST owner, particulary if you used to be a Color Computer Owner.

7. What is the best ST magazine to get and read to become familair with the ST universe?

Since all this is so basic, it can be emailed to me if you don't want to take up bandwidth in comp.sys.atari.st. With luck, I might get a new computer soon, but I want to be sure that what I might buy really is a good system that won't be deserted in a few years such as my CoCo has been.

>(C.1) of the VME bus specification. The TT030 can accommodate one
>single-Eurocard (3U) A24/D 16 or A 16/D 16 slave-only VME board,

While much of the system looks pretty competitive (of course all such feature comparison tables yet created are designed to favor the choice of their creators), I think this is a big mistake. Any new 32 bit machine with a 16-bit only expansion bus isn't going to go over well. New Amigas and Macs, along with an ever-increasing number of PCs, are providing multiple 32 bit slots. You can always plan to build everything in, but even Apple has had to admit that doesn't work very well. The choice of an industry standard bus could be a good one, especially now that VME supports chips are dense enough that you could have something other than the VME support logic in the space of a 3U card. But most of the new VME cards on the market are full 32 bit 6U and 9U cards; the simple I/O type things most desktop computer buses are normally doing are generally handled by VME mezzanine buses these days. But who knows, Apple was successful in creating a desktop version of NuBus.

>300 or 400 files) and the drive got fragmented. Unbatching large
>quantities of Usenet news was taking more time than receiving it at
>1200bps.

This is a problem on many operating systems -- they use a poor
algorithm to search in directories, so performance goes to heck, or
the directory gets fragmented on disk, which means even efficient
search algorithms can be slow. There was a discussion about this on
comp.unix.wizards recently.

The traditional work-around is grab one character from the filename
and put the file in that subdirectory with that name, i.e. "fred"
would be "f\fred". Then you end up with 36x fewer files on average
per subdirectory and things run at a traditional speed.

Of course, the best solution is to change the algorithm, and it sounds
like you guys have made the right trade-offs between memory and disk
to speed things up substantially. Is it faster than C News yet? ;-)

With my "me" (the one that came with MWC), I include "-l" in the command line and it comes up with 50/47(?) line mode. I am reasonably sure that the 'L' has to be lowercase, So it wouldn't work from the desktop, running the program as a .TTP

I didn't run any 50 line mode hacks before I did this...

Check the Buffers menu. The amount of RAM uniterm leaves for the
rest of the system is explicitly set in the "System" menu. Anything
you increase here will cause a corresponding decrease in the size of
your history buffer. (So in that respect, yes, it expands to fill
all available space, minus what you tell it to save... The history
buffer will always be whatever memory is left over from allocating
all the other buffers.)

The cheat you speak of, appeared in the April issue of ST-action. Sound interesting? When you realize it was an april fool's joke? Unfortunately many people didn't realize this, and the ST-Action offices promptly recieved hundreds of irate callers who couldn't get the cheat to work. When they found out it was supposed to be a joke, they were just that much more irate, because many were long distance callers :^) This is where the saying "don't believe everything you read" comes in...

BTW, I tried it too... ;^)

I little while ago I mentioned that I might be writing a series of articles on multitasking programming using Micro RTX. This series is now being published in USA ST World.

I have received requests to post these articles and the source programs. Now the question is should I and if so, where?

UUENCODED the text and source are fairly big (maybe 30K per article).

My feeling is that they should either be in c.s.a.st.tech or perhaps the comp.sources.atari.st group. I personally prefer the former because they are really more information than source code.

What objections does everyone have? Should they even be posted at all?

Let's discuss it.

> out and buy an EXPENSIVE multisync monitor to handle ALL of its
> various display modes.

Multisync monitors aren't all that expensive, really. $380-$500 for a decent one in Computer Shopper.

I was looking thru the Apple Educational Discount price list that was posted in misc.forsale.xxx. Even at this discount, a comparable 16MHz Mac IIcx system would cost $5140.50. (2 meg RAM, 40 MB HD, 8 bit video card, Apple RGB monitor.) For the 25MHz Mac IIci, add $800 or so to the price. At least as far as Apple is concerned, it's really tough to put together a decent comparison chart, because "comparable price" yields a useless Mac system, and "comparable features" yields a sky-high price.

I don't have any pricing info on the Amiga 3000 line, but I'll accept your statement. Someone else already mentioned the 25MHz A3000 here anyway...

(I really don't want to start an Amiga/Atari war here. Especially since I have so much fun bashing Macs, I don't want to get distracted... }-)

>3. The A3000 comes with a 68882 math coprocessor running at 25mhz,
> the TT comes with the slower 68881. I wonder what Atari will
> charge for the upgrade if you want/need it?

I don't think it'll matter. The 68882 is pin-compatible with the 68881, and I've seen a couple places advertising the 68882s for up to $100 *less* than their 68881 prices. (Don't ask me, it wasn't a typo. I called 'em up to verify. Mebbe the 881s aren't being produced in quantity, so they're getting scarcer.)

>4. As Darek noted, TOS v.X.X has and seems doomed to be forever buggy.
> The other machines listed on the table seem to have better support
> for OS updates. Are you willing to buy computer X slightly cheaper
> now only to be hung out to dry when it comes time for user support?

I am. If it's running Unix, (which seems to be the only sensible thing to do with an '030 at your disposal... }-) software support is a non-issue. Usenet has always been better software support than any program I've ever seen from any vendor.

>5. Also, as Darek noted, if/when Dave Small produces a 030 upgrade for
> the ST, you could buy a NEW Mega 2 system and a $1500 030 upgrade
> and still save well over $1000 in the cost of the TT. Go figger...

Yeah, this one's an interesting point. Still thinking about it. I guess we wait till the upgrade becomes available. For folks like me who just want more compute speed, this would be a good way to go. But you won't get the new video modes or the 12 bit palette this way. How much does a JRI color board cost? I dunno, I think there are enough new things that this is a sizeable step up from a *Mega or ST*. It's not as far a leap above an STe, though...

>Anyway, here is the table again for those who missed it...

> Comparison of standard features

> Amiga 3000 Mac IIcx Atari TT030

>CPU 68030 68030 68030

>
> I don't know of any bugs of this kind, but it will me be who would fix
> them.
>
> Alex Kiernan, HiSoft.

Alex,

The problem I had was in the integrated compiler with the Environment
command.

Well, I believe that the problem has been fixed. A kind person from the
Netherlands replied to my message a day or so ago with some interesting
information. He described a virus which steals the BIOS trap (#13) and
watches over/modifies Rwabs() actions. The virus apparently only affects
the root sector of the hard drive and modifies any program which makes a
call to Rwabs(). After changing hard drives, and re-installing Lattice,
it seems to fine so far. Does this seem reasonable to you?

Thanks for your response. If you have another mail address, let me know.
Your message came through fine to me, but it doesn't seem to want to work
the other way around.

Jim

Michael Rose asks:
>I remember seeing in some magazine a Cheat for Chaos Strikes Back.
>I could never get it to work, but it was supposed to get the
>Firestaff back by casting a spell and typing something about
>Libarsulas (sp?) smites thy down, or something like that ...

Check the date on the magazine that this appeared in... it was the
April issue... there's no such "cheat", it was an April Fools joke..

There was another one that gave a BASIC listing that was supposed to
print out the "ultimate" Dungeon Master spell, that would kill anything
that appeared before you... I showed that one to Russ and Wayne from
FTL.. they got a good laugh from it.. running the BASIC program printed
"APRIL FOOL" down the screen...

>Also, a while back I found a scroll that was in some strange language
>and I think it started off with the word Aquatanta or something like that.

Another red herring... this was left over from something that was going
to be included in the game, but was left out at the last minute.. don't
worry about it, the scroll can't be decoded...

Hi! A few days ago someone mentioned a GIF viewer for the ST that would view oversized GIF's with scroll bars, was shareware, and was available via the Panarthea archive. I was on Panarthea and saw no such program there. Could somebody tell me the name of this program, and where I might find it? The person who originally mentioned this program is not recieving his mail so I'm kinda up a creek unless somebody helps me...

Thanks for listening...

Just noticed your message about Z-Net's "official" press release from Atari NZ about the 32 MHZ TT...

Atari NZ itself said that it did no such press release, and that it knew nothing about one having being done...

In fact, the only source of the "Atari NZ press release" seems to have been Z-Net....

Anyhow, the info about the 32 MHZ TT is real, since Atari Netherlands announced it and posted it online. Also, a 32 MHZ TT is rumored to be in Canada, with more credibility than a UFO sighting...

However, it seems that the Katzenjammers at Sunnyvale will "bestow" the US with a '16' first....

Howdy everyone,
This should answer anyone's questions about AtariFest. Anyone else can contact John Barnes (JOHNBARNES@enh.nist.gov) for further info.

The Washington Area Atari Computer Enthusiasts will hold WAACE AtariFest 1990 on October 6 and 7 1990. This event will be the premier East Coast event for people who are interested in software and hardware for Atari computers. The show will be staged at the Sheraton Reston Hotel in Reston, VA. Show hours will be from 10 am to 7 pm on both days. In addition to the shopping bargains available from over thirty vendors there will be a full round of demonstrations, tutorials, and seminars. A banquet on Saturday evening will feature a special speaker on Atari matters and Current Notes Magazine's "Author of the Year" award. Special mixers will cap off the evening's festivities. Approximately 3000 visitors from all over the USA, Canada, and other foreign countries attended the 1989 edition of the show.
Admission charges are $5 for one day, with a 2-day pass available at $7. A discount rate is available for ticket purchases by user groups. Children under 12 will be admitted free.

The Sheraton Reston Hotel is a spacious, attractive facility located in a parklike setting near Washington, DC. The hotel is offering a special room rate of $59 per night plus tax to Fest goers who reserve by August 6th. This hotel room rate includes 2-day passes to the show for room occupants. Call 703-620-9000 for reservations. Be sure to mention AtariFest '90. The number or rooms available at the special rate is limited, so make your reservations now.

The price that WAACE will have to pay for tyhe exhibit space is directly tied to the numkber of hotel rooms that are rented out by the August 6th deadline. If you have have any expectation at all of attending the event we would like you to rent a room for Friday and Saturday nights.

The WAACE show has established itself as the premier Atari event for East Coast Atari fans. Bob Brodie, Atari Corporation's goodwill ambassador, has labelled the WAACE show as one of the two "must see" events for Atarians held in the USA.

>special characters on the screen and printer, and I like multiple
>windows and something capable of handling a long (200-300 page) document
>efficiently in a single file.

Well, I like it, though I have not written any 200-page long documents with it. WordUp 3.0 allows up to four windows open at once, with each window containing a seperate document. The following goodies have been added from the earlier versions of WordUp:

* Multiple columns. Mark off a section, then choose the number of columns and the space dividing them.

* On-line thesarus and dictionary. The basic package comes with a "simple" 116,000 word dictionary and thesarus (with definitions). A deluxe version is also available.

* More fonts. The package comes with a serif and sans serif font, as well as "Book Sans" and "Book Serif", a Courier (IBM typewriter) font, a fancy "Distinctive" font, and an interesting sans serif called "Corporate". Any GDOS font can be used as well, and a new system of font manipulation allows the program to load in fonts only as needed.

* A "Page preview" mode lets you see how and where your elements will be printed out. Text is not really legible at the preview, but it gives you an idea of where the page breaks occur and whre columns, boxes, lines, text and graphics will interplay.

It's not a _perfect_ program; there are some minor gripes with it (screen display refresh is less-than-lightning fast, and my version will occassionally hang when I quit the program). I don't know how many pages you can hold at once, but I suspect that's dependent on how much memory you have. Inserting and manipulating graphics is fun and easy, so if you want a low-grade desktop publiching program, this may be your cup of tea.

Other small quibbles: The user's manual is _incredibly_ bare-bones this time around, and there is still no support for true footnotes. If you can get away with writing an appendix, or using endnotes, then that's fine. If footnotes are an absolute necessity, you may need to look elsewhere.

In summary? Well, if you need an ST WYSIWYG word processor that can do a lot of Mac-like tricks, this is the program for you. You must be prepared to spend some time learning the nuances of the program, though -- all of its power and features do not come cheaply. A 7.5-8.0 on a 1-to-10 scale.

Write if you want more opinionated ramblings.

--R.J.
B-)

P.S. If you get the program, be sure to look on GEnie or Compuserve for the upgrade. The early releases of WordUp 3.0 (June 1990) have a few small bugs that are fixed in the upgrade (mostly involving more memory consumption, which would make the program crash if you tried to print).

Thanks to every one who voted for their favorite games. There
were a total of 19 replies to my request for people to vote for their
favorite Atari ST games. The mean number of games voted for per voter
was 5.4.

The following is the result of the voting where the number on the
left signifies the number of votes each game received. The order
of preference between people's votes (1st choice, second choice, etc.)
was not taken into account.

The descriptions shown are fragments of various people's reviews
mixed and matched together. I couldn't verify many of the reviews
because I am not familiar with many of the games. Some games
were voted on with no description.

A T A R I S T G A M E B A L L O T R E S U L T S

---

9 Dungeon Master
This is a very good dungeon-exploration/combat game.
Excellent 3-D graphics you can even see the slime on
the dungeon walls!digitized sound. Digitized sound,
sets a new standard in D&D style computer games.
6 Sim City
Very addictive game. The player is 'mayor' of a city and uses
his 'budget' to build public facilities (PD, FD, stadiums) and
to zone other land for commercial construction (residential,
commercial, or industrial). City grows as you go and problems
of traffic, crime, pollution, etc. arise. If your suicidal,
you can play w/ disasters on and face earthquakes, fires,
floods, monsters, etc......
5 Chaos Strikes Back
Sequel to Dungeon Master, even better.
5 Populous
Play God and wipe out other God's population
Great game for 2 people by Modem.
5 Stunt Car Racer
You've seen flight simulators? Well, this is a Driving
(Racing) simulation, where you are racing on a track that
resembles a rollercoaster, in that it is a raised track (and
ya can fall off!). You are in the car looking out the front
windshield, as you attack the 3D track. The graphics resemble
Starglider II quality, in that they are solid filled, and

update at a reasonable rate. You can race against the computer, on various complex stunt tracks, but the REAL FUN begins when you connect two ST's running the same program (only need one copy to boot both), and each opponent on their respective computer tries to beat/outwit the other driver. We play nasty, and someone usually ends up knocking the other player off the track purposely :) ... but don't worry, seconds later you are back on the track, and if you can catch 'em you can take REVENGE!

3 Elite
The old space-trading classic, tho' I started to find it getting rather "samey" as time went on.
4 Falcon
I'm sure you've heard lot's about this already...THE F-16 flight simulator. Choose mission and skill level. Higher levels are more realistic but difficult to survive in. Dogfight with computer MiGs and evade surface to air missiles. Truly a blast flying head to head at 19.2 baud (get your friend to bring his ST over...it's worth it). Also recommend the optional mission disk.
3 Starglider II
A space flight sim of large scale. Involes flying around and between planets performing missions and encountering over 130 different objects. You have to destroy an enemy battle station with a special bomb. To get the bomb, you must get various things from around the solar system.
3 Xenon II
I only have one game, which I bought after a long time of evaluation. The Game is XENON II, and I love it (did - I have blasted through all levels). It have very good graphics (antialised and everything), very smooth 2 plane scroll, and lotsa action!
2 Battle Hawks
Lucasfilm Games - WWII pacific theatre. Player can fly various carrier based aircraft in 32 different missions (16 amer, 16 Jap). Medium simulator, great game.
2 Empire
You may have seen this game on other machines but I beleive the Atari port is the best I've seen. It's a conquer the world game allowing up to 3 players. You and others (human or computer) can have advantages/handicaps. You start with a predefined world (many to choose from...you don't know what it looks like until you explore...ditto for your opponents). You must develop you're cities (you start with 1) and battleforces with the hopes of discovering and conquering. You have land, air and sea forces available (armies, planes, troop transports, aircraft carriers, destroyers, submarines, cruisers, battleships) all with different capabilities. Very good mouse implementation. Be prepared to spend hours and

hours with this game.

... but someone else said ...

Attempt to crush enemy using armies, navies, and planes. I've
seen a better version on the Mac and can envision a MUCH
better implemenation.
2 Flight Simulator II
I go back to it again and again. A learning experience. The
best flight sim. ever. Wonderfully expanded by the scenery
disks.
2 Gauntlet II
Dungeon exploration with an overhead view. A faithful copy of
the awesome arcade game. With optional adapter, supports four
people.
2 Indiana Jones Last Crusade Adventure
Mouse controlled adventure game that follows the movie.
2 Millenium
Earth has been hit by a large asteroid, and almost all life
wiped out. You have to start from a base on the moon, and
colonise the solar system.
2 Oids
Combination Chopper-Lifter & Lunar Lander
2 Pirates
You are a pirate captain in the 16th or 17th century, raiding
ships and towns on the Spanish Main. Realistic pirate
simulation with many different scenarios.
2 Rick Dangerous
Platform style game set inside a cave.
2 Silent Service
WWII submarine. Main factors of submarine warfare.
2 Super Breakout
PD game from Germany or Holland. Monochrome version of the
popular breakout games. Includes every option I've seen in
ANY breakout game and over 100 screens.
1 Arkanoid
Breakout type game with power ups.
1 Breach II
Very well-done wargame-type game. You control a squad
of men. Infiltrate enemy territory, rescue prisoners,
acquire enemy data, crack enemy computers. Includes
a scenario-builder program to "roll-your-own".
1 Carrier Command
You command a futuristic aircraft carrier, plus its complement
of aircraft and amphibious tanks. So does the computer. You
fight for control over a cluster of islands.
1 Chessmaster 2000
1 Chronoquest
An icon-driven adventure game involving a bit of time travel.
Pretty graphics, nice music, some difficult puzzles.
1 Damocles

Took a long time, but worth the wait. Brilliant exploration and clue solving action.
1 Drachen
Remove a stack of Majong pieces as quick as possible.
1 Fighter Bomber
Excellent simulator (dubiously realistic but when it's this much fun - who cares?). Better than F29 or Falcon.
1 Full Metal Planet
An EMPIRE type game, idea is to get as much ore as possible...leave the planet with more ore then the other player. Involves combat with the other player's units. NICE graphics. Based on a board game, I believe. I think this game supports STe graphics.
1 Future Wars
1 Gravity
fascinating strategy/action game, complex, great graphics.
1 Great Giana Sisters
Excellent Super Mario Brothers clone.
1 Gunship
I think this is pretty close to tied with Falcon. This is the AH-64A Apache helicopter flight simulator and has numerous reality levels, missions and terrain.
1 Hitchhiker's Guide To The Galaxy
Infocom textual adventure game based roughly on the book/ radio show/television series. Characters and general circumstances are the same but story line differs so people familiar with the story will still enjoy the game. Very funny. Douglas Adams worked on teh game development.
1 In Harm's Way
WWII. No graphics. Lets you give commands for a naval battle. Simple but fairly good. (expensive).
1 International Karate
A karate game with great graphics and a real nice user interface. It's easy to use and fun. Can play solo or with another player. You fight against two others, at least one of which is computer played.
1 Interphase
This is kinda a takeoff from the book Neuromancer in which you have a partner in the real world trying to get to the top of this building (7 levels). You use the Interphase to communicate with her. This is a type of virtual reality that you 'fly' through and security items are represented by various 3D objects that you must manipulate/destroy. Currently number 1 as I just got it and I'm having a lot of fun with it...up to level 5 (been a few weeks of irregular play). Combo shoot 'em up, fly around and strategy/adventure game.

1 Kick Off
The best football/soccer sim. available. Small sprites but fast hectic action. Soon to be improved in Kick Off II (if

possible!).
1 Larn
Public domain. Kill the monster's and find the treasure. Hack and Rogue are similar.
1 Man Hunter
1 Mid Winter
Strategy game after nuclear winter. Character's personalities interact.
1 Mines
Cross a mine field successfully.
1 Monopoly
I dunno-- just something about this game that is very addicting...
1 Net Hack
1 Omega
This was my current favorite...Hard to call this a game unless you think programming is fun. You have to design/write the intelligence for a tank. You start with fairly basic 'hardware' components and if you tank does well enough in the simulations you get more credits and can get better 'hardware'. You can also design battlefields and simulations and it comes with a 'debugger'. This game is also availble for the IBM and Amiga so you can pit your tanks against your friends (the tank design files are compatible between machines...). The progamming language is a bit lame and has at least 2 bugs but still a blast.
1 Shuffle Puck Cafe
A very realistic shuffle board/air hockey type game with excellent mouse control...quick and easy to learn/play.
1 Stellar Crusade
Wargame between computer and player, or two players. The opponents fight for control over a cluster of stars, and must colonise the star systems as well as fight for them.
1 Sundog
An early Atari favorite. An animated trading simulation where you try to "buy low" go elsewhere and "sell high". Watch out for pirates and keep your ship in good repair.
1 Tetris
The Soviet game of dropping shapes.
1 The Pawn
A rather nice text adventure game with accompanying artwork that I actually managed to solve!
1 The Sentinal
An aging game of strategy unlike anything else, involving moving around fractal landscapes manipulating energy. Very ethereal.
2 Time Bandit
Arcade type game with an underlying adventure game scenario. There are numerous thematic 'time zones' which scrolling rooms and monsters all in beautiful color. You

shoot the monsters while trying to get treasure (for extra lives) and the keys to get out. As you do this you will learn about the underlying story of the time zone you are in and will try to solve the adventure. Split screen allows two players to cooperate at the same time. Fast, colorful graphics.
1 Umoria
Your normal everyday Rogue-type game.
1 Warhead
A stunningly atmospheric space combat game. Has real class.
1 Warship
World War II Navel simulation. Fairly realistic, but several bugs (none of which make it crash). Let's you figure out how to fight naval battles.
1 XyBots
This is a good game to play with one other person. In two player mode, it is on a split screen. It has simple but good 3D graphics (Maybe simulated 3D is a better word?). You walk through this space station blasting robots and try to kill the Master Robot at the end. Nice shoot-em-up. Based on an Arcade game.

The documents you mention are part of the Atari developers' kit. Therefore, they are not public domain. That is unless Atari has suddenly been stricken with a fit of generosity.

Two mistakes were in my previous posting, because I added a final vote and forgot to resort the list of games:

(1) Falcon received an additional vote and so should have been placed before Elite:

> 4 Falcon
> I'm sure you've heard lot's about this already...THE F-16
> flight simulator. Choose mission and skill level. Higher
> levels are more realistic but difficult to survive in.
> Dogfight with computer MiGs and evade surface to air

The Hitch Hiker's Guide to the BIOS is part of the devkit, so it is
not public domain. You can find that information in various books
about the ST. However, the GEMDOS guide and the Pexec cookbook have
both been posted to the net in the past, and I think the Pexec
cookbook was even actually released to the public. However, I'm not a
lawyer.

The bottom line is, don't be so snappy.

Well, I basically agree, i.e. it can do a lot of Mac-like
tricks. In fact, I felt that v2.0 the most Mac-like
wordprocessor I had ever seen for the ST. I really haven't
used 3.0 all that much, but it looks like there is much less
cursor flicker, which was distracting in 2.0, and it seems to
be quicker, too. The main improvement made (as far as I'm
concerned) is the simplification of using GDOS. I'm not %100
sure I understand it all, but it seems that you don't have all
the hassles with the ASSIGN.SYS file that you have in a
regular GDOS application (although, maybe G+PLUS would
alleviate this situation anyway). My main problem with WordUp
is that it doesn't support continuous scrolling through a
document on the scroll bar with TOS 1.0. I mentioned this to
Neocept as a potential enhancement for 2.0 to 3.0, but they
just told me to get TOS 1.4(which I don't see doing any time
soon) and that would all be taken care of. Finally, remember
that you'll need a font editor to make your own special fonts.
FONTZ (also from Neocept) worked fine for me.
So, I guess that is it. I feel this is the closest I've
gotten to wordprocessing like on a Mac on an ST...just
remember: it still isn't a Mac (which is why I've got
Spectre!)

Dr. T's Keyboard Controlled Sequencer ver 1.5

An excellent, full featured MIDI sequencer for the Atari ST
Original disk, box, and manual. This is an older version, but still is
capable of serious music sequencing. Asking $50.00 or best offer.

Leave message if interested...

Later,
Brian Daniels

price/availability? + uncompatible disk format.

> It almost sounds like the CoCo 4 Tandy never came out with. So here are my
> questions about the Atari ST line:

General problem: The atari ST is an endangered specie: It didn't sell enough
to get the critical mass to interest software companies. With no successor
(apart a vapourware TT which is already obsolete before being out), it will
be in the same situation as the CoCo3 in one year.

It is still a valid choice for some precise uses, for instance:

- as a multi-windowing terminal emulator, due to its superb mono screen, cheap
price, and the "term" (uw-derived) terminal emulator. Our organisation,
INRIA, did not buy any ascii terminal since 2 years, only STs.
Drawback: horrible keyboard.

- as a game machine, for an european user (my use). In france it is cheap, so
games are cheap.
Drawback: Now, more and more of the better "adult" (strategic, simulations)
games are developed on PCs, STs having all the flashpan kid arcade games.
Exceptions: FTL and Bullfrog.

- Some specialized programs, such as calamus, are perhaps worth byuing an ST for. But would you invest one year of your work on an exotic program, incompatible with the rest of the world? Personaly I used my ST to do all the drawings of my thesis with easy-draw, but it was a pain to translate them to postscript for latex inclusion...

- for the unix user, you have emacs, Latex, some shells, tar, etc... before leaving work, I just do a "tar cf /dev/floppy ." on my unix box, take the disk home, and continue to edit my sork under microemacs on my ST at home

In my opinion, get a taiwanese 386 PC VGA compatible. That's the route I will follow as soon as they will cost less than the price I payed my first ST, about $1500 (now you have a 286 for this price). I had STs for the past three years, enjoyed them, but their time is counted... The amiga may survive since it has a credible successor with the A3000, but it is much more expensive than PC-compatibles for non professional graphic uses.

>called 'ST Magazin' or something) I decided I would let someone more experienced
>should do the work for me.
>Looking in my computer I see 2 SIMMs, and a *LOT* of wire.

I, for one, doubt that you are *at all* able to make the ST use 3.0 MB. There
are two banks of memory, each wth either 0.5 MB or 2.0MB. That makes

0.5 MB 1x0.5
1.0 MB 2x0.5
2.0 MB 1x2.0
2.5 MB 1x0.5 + 1x2.0 Not available from Atari ...
4.0 MB 2x2.0

The above calculation is based on the fact that the MMU knows about
two banks, NO MORE. the nice thing (;-)) is that the MMU autodetects.. .

So, no unused 0.5 MB in a 2.5MB installation, no 3.0 MB installation
possible.

Disclaimer
This may not be true for STEs, I don't know.. .
Do correct me if I'm wrong.

IF I'm wrong, please give a reference to the relevant article.. .
(I have seen ads for 5.0MB extensions, where the last 1 MB was
used for RAM disk, so perhaps....)

brian@wolves.uucp (Brian Daniels) writes:

>Is it possible to connect an IBM AT-style keyboard to a 1040ST without
>excessive chaos?

In short, no. Cause: incompatible scan codes.

On the other hand, you can buy a hardware modification in Germany
that consists of a replacement keyboard/IO processsor and a new
connector. Insert the new keyboard processor, set up the connector,
and, *WHAM*, there you are. Cute. The problem that is solved by the
new processor is that the only *really* compatible solution is to
patch the keyboard processor program. Alternative solutions based
on a new keyboard and some software hacks just aren't that compatible.

(disclaimer: I don't even have one of the things ! I only saw an ad).

> RGB monitor.) For the 25MHz Mac IIci, add $800 or so to the price.

Well that's all relative to which school you go to since each school is
at a different discount level. Its some what less than a thousand dollars
less here for the system you mentioned here at Brown. When I can get a
nice system like a cx which has good support for a not that much more than
what a TT costs then it gets harder to stay... It seems that Atari really
needs to do something that makes everyone go wow! like they did with when
the ST was released. It seems boosting the base TT up to 32Mhz might just
do that.

> > Comparison of standard features
>
> > Amiga 3000 Mac IIcx Atari TT030

This is one of the most lopsided tables I've seen recently (and I was just
reading MacWorld :-).

> >RAM 2 to 17 1 to 32 2 to 26
^^ -- it's 8 meg under Mac OS

> >ROM 512K 256K 512K
^^ -- they upped it 512k in the ci if
I remember correctly.

> > Max resolution 1280 x 480 Optional 1280 x 960
^^ Optional graphics?? I haven't met
a mac user who decided not buy the graphics capatibilities:-)
That's stretching the definition a bit thin. Atari just didn't want to say
that Mac graphics out-do the TT's graphics in the Mac II's base config.

> >Hard disk DMA Non-DMA DMA
^^ Yeah, but just as fast in normal
use.

> KEYBOARD yes OPTIONAL!! Yes
>
> Mouse is optional??!! $165 for a stupid *keyboard* ?? And these are the
> Educational Discount prices? Geeze... Makes you wonder at the folks
> running "Higher Education" ...

Well, the mouse does come with the computer but a lot of good that'll do you without the keyboard. $165 will get you the big AT keyboard, you get the smaller one for about half the price. Of course that's still a silly price since we all know that students are just Mr. Moneybags :-)

Cheers,
Marshall

First, thanks for announcing the publication of the articles. I would
appreciate it if you would publish them in c.s.a.st.tech. In my
understanding, that is the reason the newsgroup was created. I am
also looking for more info on RTX since I'm considering writing a
multitasking application for my ST (for some volunteer work I do.)
Thanks for the offer, I hope you take yourself up on it. :-)

>AAron@sun.soe.clarkson.edu

MicroEMACS 3.10, which runs on the ST series, will allow you to
add the line:

set $sres DENSE

to your emacs.rc file and it will come up in 50 line mode on a
monochrome monitor. Also you can type

^SA$sres<NL>DENSE<NL>

to do this while in EMACS. LOW and MEDIUM are also modes that
will control the screen resolution in the above commands.

Hi!

I'm modifying the ST wini driver to deal with hdx 3.0 partitioning.
Now I'm left with a few questions:
1) What is the maximum # of partitions possible?
2) Can the partition inside an XGM partition have other types than
GEM and BGM (e.g. MIX). Of course I mean the regular partitions, not
the links.

Thanks,

908. connect 2 hard disks to one controller

Newsgroup: comp.sys.atari.st
Date: 1990-07-23 19:42:53 UTC
From: meulenbr@cst.philips.nl
Message-ID: <meulenbr.648762173@cst>
Source record: 239629

Hi,

I'm trying to connect two drives to one Adaptec 4000 controller,
using both lun 0 and lun 1.
The problem is that I do not get a response from the drive at lun 1.
I've swapped cables, disks etc. (but not the adaptec, since I only have
one).
I have two small cables which go each to a drive.
As far as the big connector concerns, I've mounted an additional
connector on the cable so now I can connect both drives.

I'm not only not able to get 2 drives working. If they are both
connected, the drive at lun 0 will not operate eiter.
Also, using software which checks all scsi/lun combinations, I cannot
get a single drive at lun 1 (none connected at lun 0) recognized.

Has anyone seen this problem before?
Something wrong with my adaptec?
Something wrong with me ? :-)

Thanks in advance for any help,

909. Comments in the STart MIDI-tasking article

Newsgroup: comp.sys.atari.st
Date: 1990-07-23 19:46:12 UTC
From: ric@mcrware.UUCP
Message-ID: <2221@mcrware.UUCP>
Source record: 239625

In the August 1990 STart magazine, "Multitasking on the ST", Atari's Frank Foster is quoted as saying: "The makers of the ST don't think that multitasking could be properly done on a Motorola 68000-based machine. Any such system is a kludge." [Paraphrase, don't sue me].

Seeing this information, everyone here quit working and locked the doors. No need to continue work on a kludge that will never work anyway, eh? :-) Do they think this is a really good way to encourage third party developers?

Sorry, I get a little excited sometimes. You can continue reading the News.

The latest catalog (No. E27) from E. Arthur Brown Co. includes the following:

ST/PC Keyboard Interface
Pre-review by Eben Brown
Our new ZKEY's interface allows you to connect
an IBM PC/XT/AT compatible keyboard to your Atari
ST. Let's face it, there are some really nice
aftermarket keyboards made for PC Compatibles.
Many are more sensitive and better feeling than
our original Atari ST keyboards. With this new
ZKEYs interface, you can adapt one of those
keyboards for use on your Atari ST!
The ZKEYs interface actually piggy-backs inside
your computer between the Atari ST keyboard
connector and its connecting jack. There is no
soldering ... just plug it in. Your ST keyboard
remains fully functional even though can connect
a PC keyboard!
These ZKEYs interfaces are brand new and should
be shipping around the end of July. We expect a
pretty hot demand for them, so please order early!
242-600 ZKEYs Interface 1 lb $89.95

I have not seen the above product. I prefer the ST keyboard.

E. Arthur Brown Co. can be reached at:
3404 Pawnee Drive
Alexandria, MN 56308 USA

Toll-free order phone from USA: 1-800-322-4405
Regular telephone: 1-612-762-8847

Their catalog features current ST items (software and hardware) at very good prices, plus close-out and special bargains. They are liquidating GFA Draft Plus, GFA Artist, GFA RayTrace and Aegis Animator at $19.95; and Regent Word II Collegiate and C-Breeze (text editor for C) at $14.95. Calamus is $167.95 and PageStream is $114.95. They also sell an assortment of RAM upgrade boards, hard drive adaptors, the Michtron FAX modem, etc.

I have no connection to the E. Arthur Brown Co., although I have purchased items from them in the past and received good service.

Please, can we not have these "I dumped my ST and bought an X
because..." articles? They don't contribute anything useful to the
group, and cause needless flamewars. Different people have different
needs in a computer, and you needn't justify your decision in front of
the entire planet.

By the way, Colas, if you want ANSI C you could try Turbo C or gcc.

That is a myth that needs deflating. I don't buy that argument
against *any* currently available 16-bit computer (except perhaps the
Apple IIGS, which has been abandoned by its mother). The standard
business applications -- word processing, spreadsheets, database
management, etc. -- are well covered. (How many word processors do
you need, anyway?)

What amazes me is the oddball applications that keep turning up.
Restaurant ordering systems, point-of-sale terminals (cash
registers), industrial embroidery machine controllers, telephone
directory assistance consoles ... I keep hearing about STs in the
oddest places.

Why? Because any brickhead like myself can program them, and good
programmers can really make them sit up and put on a show. The ST is
not a hostile environment.

There is a distribution problem. It is unreasonably hard to find the
commercial software that is available. But that's doesn't mean it
doesn't exist.

> - Some specialized programs, such as calamus, are perhaps worth byuing an ST

I just converted a GEM metafile that had been created by Easy-Draw to
PostScript this afternoon using Pagestream.

> In my opinion, get a taiwanese 386 PC VGA compatible. That's the route I will
> follow as soon as they will cost less than the price I payed my first ST,

> about $1500 (now you have a 286 for this price).

The original poster likes OS-9 and Motorola assembly language. PC clones have their places, but I sure wouldn't inflict them on someone with those interests. Crazy memory models, incompatible video modes, overpriced software, severe RAM limitations ... who needs it? If your boss makes you buy one, that's one thing, but for a hobby, why do it to yourself?

The only excuse for a '386 box that I can think of is Unix, and Unix for a '386 costs as much as my ST.

915. More fun with LZH

Newsgroup: comp.sys.atari.st
Date: 1990-07-24 06:19:08 UTC
From: steve@thelake.mn.org
Message-ID: <A174331128@thelake.mn.org>
Source record: 239638

Note the differences in the dates and CRCs on the following listings.

```
Original Packed Ratio Stamp Methd CRC Name
-------- ------- ------ ---------------- ----- ---- --------------------
19811 8287 41.8% Jan 1 05:45 1970 -lh1- 1aec pinhead.txt
2652 1592 60.0% Jan 1 05:45 1970 -lh1- a2d9 pinhed17.prg
-------- ------- ------ ---------------- ----- ---- --------------------
22463 9879 43.9% Jul 24 00:46 1990 2 files Total
Name Actual Packed Ratio Time Date Attr Methd CRC
------------ --------- --------- ----- -------- --------- ---- ----- ----
PINHEAD .TXT 19,811 8,287 41.8% 19:08:20 12 May 90 ...a -lh1- 372E
PINHED17.PRG 2,652 1,592 60.0% 19:08:22 12 May 90 ...a -lh1- 372E
------------ --------- --------- ----- -------- --------- ---- ----- ----
2 files 22,463 9,879 44.0% 00:46:52 24 Jul 90 ....
```

The program that created the top listing unpacks files that crash my shell when I try to list their (illegal date!) directory entries. The program that created the bottom listing generates CRC errors. Ever wonder why I don't like LZH programs? If I wanted to squish files so that I could never use them again, I would use a magnet.

Sorry if I sounded this way. I exposed also the reasons that made our
organization still buy STs, and the reasons why I use mine.

My point was: I think the ST could have been a general purpose computer,
"the apple II of the late 80s", but now it is well adapted for some uses, but
not for all.

I offer to "repair" my posting by summarizing and posting a list of relevant
uses for a ST. Mail me your experiences, I will post them.

Hello all,

I have an atari STE and i have been trying to hook up
IBM Ps/2 VGA Colour & Mono monitors. I seem to be having some problem
with either the horizontal sync or the horizontal scan rate though.
The colurs are OK and i get a stable picture but the screen seems to
be shifted to the right by about 3 inches and wraps round and comes
back on the left of the screen to overlap the picture allready there.
Does anybody have any ideas as to how an IBM VGA monitor is different to
a normal RGB (Multisync?) monitor.
I Have tried both inverting the Horizontal Sync and delaying the Sync
but the screen is still shifted to the right.

Thank you for any ideas you may have

Kevin Cooper.

From: ralph@laas.fr
Message-ID: <RALPH.90Jul24115615@cresus.laas.fr>
Source record: 239634

I recently upgraded my 1040 ST running TOS 1.0 to a Mega 4 ST running
TOS 1.2 (unfortunately TOS 1.4 is not yet available in France ;-().
My question: should my Mega have a Blitter? My dealer was ignorant on
the subject and didn't want to open up the machine. Normally, if
there is a Blitter there should be in the Options menu the Blitter
on/off option, right? My Options menu is no different than on my old
1040 ST.

Am I up the creek? Considering the sale price for which I got the
machine, I still can't complain.... but?

919. GEMBOOT v. 1.11

Newsgroup: comp.sys.atari.st
Date: 1990-07-24 09:59:34 UTC
From: ralph@laas.fr
Message-ID: <RALPH.90Jul24115934@cresus.laas.fr>
Source record: 239502

It seems that GEMBOOT does not function on a 4 Mb Mega ST. Does there exist a version which does function? Don't tell me to use FOLDRnnn.PRG (I'm using it for the moment) since GEMBOOT provides environment variables and BATCH executable files on boot-up.

Thanks,

Yes - you *ARE* wrong. First: 2.5 Mb is *NO* *PROBLEM* *AT* *ALL*. Like you say, 0.5-Mb bank go nicely together. The mere fact that Atari ships no 2.5 Mb-equippe

"
this configuration impossible. 3.0 Mb is possible too; but it really is a hack
to get around the 2 bank limit. I will describe that in the following article.

The following stuff really should be put in the 'tech' newsgroup, but I started
request to Dave Small ... anyway, here it is.

My ST *DEFINITIVELY* has 3.0 Mb. I agree, not long ago I thought this impossible
the magazine "ST Computer" 3/1990 (a German magazine), the author K. D.
Litteck describes how it is done (the article is called "Aus zwei und ein halb m
German, and my German is not too good, but I'll try to describe the article
accurately.

How does it work? Well after determining memory configuration (see below) TOS st
amount of memory it thinks is available. Say you've got 3.0 Mb available
(like I do); TOS at first thinks 2 banks of 2 Mb are available and sets out to c
then runs into nonexistent memory when it reaches the end of the three
available megabytes. En exception occurs of type buserror occurs, at which is de
adress the error occurred. This adress is then written in the TOS variable
phystop, thus setting the correct memory size. Now TOS boots on ...
This works like this in all TOS versions known to mankind.

For technical details see part 2 of this posting.

"Talking about Math can almost be as satisfying as the real thing,
and not half so risky."

922. 3 MB - Yessir! (pt. 2)

Newsgroup: comp.sys.atari.st
Date: 1990-07-24 11:53:58 UTC
From: jeroen@plato.phil.ruu.nl
Message-ID: <587@accucx.cc.ruu.nl>
Source record: 239646

This is part 2 of an article about ST memory upgrading (technical part).

Before getting into the gruesome details, first some general ST memory theory:
ST is equipped with Dynamic RAM, and for every memory location a single transist
allows for high speed and compact chips. However, the chips need to
be refreshed about every 2 millisecs, of which the MMU (among other things)
takes care.

The DRAMS are bitwise accessed; therefore, the ST adressing in 16 bits, only ban
be used. Now the adressing signal is multiplexed (at one adress line two
adresses are located, that are consecutively transferred). In DRAM these adresseMx
separated. This keeps the number of pins as small as possible. The multiplexing
signals is catered for by the MMU too.

Now the multiplexing is the reason the DRAMS can only be increased in 4-folds; oing
kBit, 256 kBit, 1 MBit and 4 MBit chips currently exist.

Two control lines (called RAS and CAS) are of interest (both low-active). RAS tr
adress of the multiplexed adress line, CAS the high adress. They work too as
chip-selectors. The signal WE selects READ or WRITE mode.
Further, the ST divides CAS into CASL and CASH. CASL goes to the chips on adress
to 8..15, so that memory can be byte-accessed too. On WORD-read or write
both CASL and CASH are active.

The ST's MMU can manage two banks of memory. For bank 0 the control lines RAS0,
used, bank 1 uses RAS1, CAS1L and CAS1H. These banks can be equipped with
64, 256 or 1024 kBit chips.
On coldstart TOS writes patterns in memory and reads them back (all at well-chos
determine the memory configuration, and stores in the system variable memconf (a
MMU's configuration register ($FF8001) a configuration byte:

Bank 0: Bank 1: Value: Total memory:

512 k - $04 0.5 M
512 k 512 k $05 1.0 M
2.0 M - $08 2.0 M
2.0 M 512 k $09 2.5 M
512 k 2.0 M $06 2.5 M
2.0 M 2.0 M $0A 4.0 M

(hope I got this right!)

On top of all this, MMU also manages to make memory contiguous: allthough the ad
bank is 2.0 Mb, in case your bank 0 is 512 k and 1 is 2.0 M the MMU
concatenates the total adressing space to a contiguous one (as TOS expects).

Now, that's all very well: now we want to fool the MMU to handle up to 5 (!) mem2.0
post a scan of the electronics scheme in MacPaint format (you need it!)

We need adress line A9 (not used on 256 kBit chips). It is multiplexed and conta chi
adresses A18 and A19. Both NAND-gates serve as OR-gate and should release
the D-Latch 1 and 2 when CAS1L or CAS1H become active. An IC 74LS375 demultiplex
A9 the adresses A18 and A19. With the D-Latch 3 A18 is obtained, with
D-Latch 1 A19. A18 is also led over D-latch 2, being kept until CAS goes high.
The IC 74LS139 (2-bit binary decoder) produces with A18, A19, CAS1L and CAS1H ei
of which we only need four.
These four signals are fed to the memory banks (all formerly 0).

Now, some things to pay attention to:
- the 2.0 Mb should be bank 0;
- the RAS0-line must be broken;
- the assignment of RAS- and CAS-lines MUST be corresponding.

MMU pin configuration:
6: CAS0H
7: CAS0L
8: RAS0
18: RAS1
21: CAS1L
22: CAS1H
64: A9

Components:
- 1 IC 74LS00
- 1 IC 74LS375
- 1 IC 74LS139
- 4 68 Ohm resistors
- 1 Block condensator
- 1 microFahrad wire or copper litze

I hope this is clear enough to you all (once you've seen the picture accompaning
"Talking about Math can almost be as satisfying as the real thing,
and not half so risky."
cf. 'The Bluffer's Guide to Bluffing'

923. Re: Writing ST floppies on a SUN SparcStation (Need help).

Newsgroup: comp.sys.atari.st

Source record: 239503
Cross-posted to: comp.sys.atari.st,comp.sys.ibm.pc

In article <1990Jun22.105700.5878@planet.bt.co.uk> rmh@planet.bt.co.uk (Ray Hollett) writes:
|
| I am attempting to use a SUN Sparc Station 1 to put files from the Net onto
| 720k floppy disks for use on my ST. I have been using the MTOOLS (with the
| 3 patches) software to write PC compatible files on the SUN, but these are
| not correctly read by the ST.

Even PC applications will break and not be able to read the floppies.

| The files seem to be OK when read on a PC, but on the ST the first couple of
| sectors are repeated thoughout the file. I suspect that there is a problem
| with the FAT formats used; can anybody explain the problem or suggest a fix.

I have found two problems with MTools formatting and updating of FATs.
MTools 1) creates by default an all-blanks volume-id (which breaks the
gulam shell, for instance), and 2) does not update the second FAT
after writes (a simple #undef to #define problem). So here is my
unofficial Patch4 to mtools which is 100 % compatible with PCs and STs
(at least for me!). Yes, there are a few residual problems with
MTools.

By the way, do you STers ever use `patch' on your ST to update sources
from USENET? I recently used it to update Sozobon 1.2 according to
the patches posted in comp.sys.atari.st. It's great! It was written
by John R. Dunning. Maybe someone should post an updated version to
the net.

In article <2221@mcrware.UUCP> ric@mcrware.UUCP (Ric Yeates) writes:
>In the August 1990 STart magazine, "Multitasking on the ST", Atari's
>Frank Foster is quoted as saying: "The makers of the ST don't think that
>multitasking could be properly done on a Motorola 68000-based machine.
>Any such system is a kludge." [Paraphrase, don't sue me].
>
>Seeing this information, everyone here quit working and locked the doors.
>No need to continue work on a kludge that will never work anyway, eh? :-) Do
>they think this is a really good way to encourage third party developers?

At least they didn't flame you by name; they specifically slammed Beckmeyer:

Questioned about Atari's policy in view of an existing multitasking
system such as Beckmeyer's Micro RTX/MT C-shell, Foster dismissed it
as one that "[works] but not very well."

Yay, applause from the galley! Death to the filthy/nasty 3rd-party Huns!

I've just figured out what Atari's problem is: all the other players in
their market are bowling; Atari is playing golf. They double-bogeyed
with the original ST, but happily have been playing under par ever since...

Hello to all possible buyers ;-)

I intend to sell my Atari Transputer Workstation ATW 800 Issue 4
because now I have enough Transputers to work with in
a parsytec MultiCluster at University of Kaiserslautern.

The ATW includes:
Software:
HELIOS 1.1
X Windows 11.2 (X11R4: autumn 1990)

Hardware:
T800 20Mhz / 10 MIPS
4 MB Main Memory
1 MB Dual Ported Video RAM
Atari Mega ST incl. 1 MB RAM (all ST peripherals usable) as Server (TOS 1.4)
44 MB SCSI Harddisk
3.5" Floppy
16.7 million colors, > 1 million pixels
Blossom Blitter
Mouse
...

6 months old, manufactured in Braunschweig, West Germany
no failures

Price:
14,950 Deutsche Mark (West)
(I'm authorized to declare 14% German Umsatzsteuer tax, so
DM 13114.04 effective costs for YOU.)

>-Mike

I haven't got the ad with me at the moment, so I cant remember all the
details, but Evesham Micros (in the UK) do one. The adverrtisment I
saw quoted 200 pounds for a fully populated 2.5 meg upgrade, or (I
think) 50 pounds for the unpopulated board. It will work with any ST,
will go up to 4 meg, and is, apparrently, a solderless upgrade.
Hope thats some Hellp (arghh, why does this keyboard repeat some
characters on me?)

Kev.

I haven't appointed myself anything. I'm just trying to use a little common sense. Too bad you don't think before you post. Isn't it about time for you to start telling us how badly Atari is doing in the stock market?

>>By the way, Colas, if you want ANSI C you could try Turbo C or gcc.
>
>I was under the impression that Turbo C was only available in Europe
>and that GCC is PD (no professional support)??

Colas is from France. Last time I checked, France was in Europe. In addition, GCC is "free" but you may purchase support from it from any of a number of individuals and corporations. I use it without support every day and haven't had any trouble whatsoever.

>Send flames to /dev/null |El Guerrero Aereo es el rey!

Too bad you don't take your own advice, Chris. The posting of mine that you flamed had information in it; did your flame have any?

I just wanted to comment on one thing Howard said:

In article <1990Jul20.233102.24577@math.lsa.umich.edu>
hyc@math.lsa.umich.edu (Howard Chu) writes:
>I am. If it's running Unix, (which seems to be the only sensible thing to
>do with an '030 at your disposal... }-) software support is a non-issue.
>Usenet has always been better software support than any program I've ever
>seen from any vendor.

I disagree that software support for Unix is a non-issue. Perhaps that
may be true for a "toy" machine (for personal use), but for professional
development, one really hairy driver bug which the vendor can't fix can
really foul up a project and cost lot's of $$$.

End-user training type support isn't a big deal. There are lot's of people
that can help with that. It's the vendor supplied drivers and kernel hacks
that can be a problem if the vendor can't (or won't) fix broken things,
especially if you're a VAR and want to sell the platform to clients.
The thing has to work. The turn-key system buyer isn't going to spend
time on Usenet getting support.

THe atari ST is definately NOT an endangered specie in Europe, it did sell
very well here and much software is available. Maybe this is not
very well distributed in the US, but good software is developped for it,
which could always be ordered in Europe. Especially in Germany and Holland.
(for example Turbo C, that was developped by Heimsoeth in Germany).

Turbo C is that good and fast that it is worthwile to order it in Europe
even if you're in the US.
Have you ever worked with gcc? It may be PD, but it is very good and
has a nice, quit UNIX like library that makes it easy to compile a lot
of UNIX sources without many modifications.
gcc is used on many workstations (SUN,CONVEX minisuper,HP etc.) instead
of the original compilers because it is of such high quality.

Don't underestimate the value of good PD software being available for
a computer.

> ATT Bell Labs
> att!lzsc!hcj
> hcj@lzsc.att.com

What did Steve Grim do to you? Bite you?? I don't need the
answer to that, really! 8-)

Sure, things seem to be slow and I currently have a problem
receiving stuff here (that queue must be awful big, or aliased to
dev/null), but if that's all there is to it, why not send submissions
to what used to be known as terminator at umich (sorry, haven't got
the address here to hand). Tell us about it on c.s.a.s or c.s.a.s.t
and let us use the new mail server there if we can't ftp - like me.

The competition may spur Steve on and/or spreading the load
of submissions may let him catch up on his backlog.

If you question Mr. Grimm's judgement of what's appropriate
for the net, (you see, my memory is begining to work, finally) you now
have a sort of court of appeal at the umich site. If everybody turns
it down, you lost the appeal, it's too commercial or something for
usenet. Sorry 'bout explicitly naming you net guardians, umich guys,
but it comes with the territory. What matters in the end is the
availability to the net of a submission, not where it comes from.

A file this size is simply _WAY_ too big to post to news - sending 250K to each of the thousands of sites that get this newsgroup represents an enormous load on the whole network, especially considering the relatively small number of readers who need this patch and don't have access to it from another source. Submitting this to Panarthea and Terminator would be more than adequate.

I'm not trying to flame, but to remind readers in general of appropriate news etiquette, which I'm sure I violate on occasion :-). As a site which receives all news view a modem and long-distance, I'm kind of sensitive to excessive use of bandwidth...

>> charge for the upgrade if you want/need it?

>I don't think it'll matter. The 68882 is pin-compatible with the 68881,

It may very well matter, if the difference between 68881 and 68882 matters to you. While they are pin compatible, there's an awfully good chance that the TT will have a surface mounted 6888x. Which is all but impossible to replace with a different chip, unless you have specialized equipment. By the way, the 16MHz A3000s are also using the 16MHz 68881 at present, and it is surface mounted. I don't know which FPU is in the 15.8MHz Mac IIcx, but it is also surface mounted.

>and I've seen a couple places advertising the 68882s for up to $100 *less*
>than their 68881 prices.

If you're paying anywhere _near_ $100 for a 16MHz '881 or '882, you might consider changing your store. I would imagine that Motorola isn't making many '881s these days, and I did hear that '882s are much easier to make than '881s in speeds of 25MHz on up.

>Usenet has always been better software support than any program I've ever
>seen from any vendor.

Just where did they post that public domain schematic capture program? Maybe comp.source.when.hell.freezes.over? Yeah, that's the ticket. The same place they posted the PD clone of PageStream....

I'm sick and tired of reading the incessant heckling of the ST in your posts, Chris. After your continual slamming of the atari, you decide to post a message declaiming those who provide the inverse service to this newsgroup. You've essentially crowned yourself head.flamer for c.s.a.s.. (And why should anyone use email, with your sterling examples to guide them?)

>
>I was under the impression that Turbo C was only available in Europe
>and that GCC is PD (no professional support)??
>

I wouldn't know about Turbo C, but GCC for the Atari ST is officially sanctioned by the Free Software Foundation, which is as much as it gets for any machine on which it runs. The faculty at CWRU seem to consider this enough, as GCC is the compiler used on the majority of the workstations I've seen (or used) at the school.

ljdickey@water.waterloo.edu (L.J.Dickey) writes:

>Someone mentioned a program called SuperBase.
>I have not heard of this.
>Can anyone give me more information about this?

Funny you should ask - I just bought a copy of SuperBase Personal II by
Precision Software this weekend. I am still familiarizing myself with
it. Here's what I think I have:

* a fairly sophisticated, menu-driven relational data base

* data is stored and accessed on disk, so the size of the database is limited
not by available memory (as in, say, Base Two) but by your mass storage
media

* can import and export ASCII, DIF, dBase III, dBase IV and Lotus 123 files

* has been implemented for Amiga, IBM PC clones, and Macintosh

My impressions thus far are very positive. I think this is a MUCH more
capable program than Base Two, yet you can safely ignore much of the complexity
if you so wish. One thing for sure, the FILTER options are much nicer
and flexible. My sole complaint so far is that the program doesn't use
the built-in TOS file selector, but some custom dialogs instead. This
must be a reflection of designing the program to be ported to many platforms.
Oh well, that's what UIS III and the CALL_UIS.ACC are for. I don't see
this as a big problem - I don't do much file manipulation when I use a
database, I tend to be working with the program mostly, not the file
system.

The reason I chose this program is to answer some problems which Base Two has
sensitized me to:

1) It can import data in many forms; Base Two can't even read in ASCII.
2) It can export to Lotus (and hence, LDW Power); Base Two can't.
3) If I move to a PC/Amiga/Mac (oh, I hope I don't have to!), I can move
my data base to Superbase or dBase on those platforms.
4) It's gotta have better report generation (couldn't be worse)!

If there's interest, I'll post more as I learn about it.

Message-ID: <6526.26acbc7d@uwovax.uwo.ca>
Source record: 239509

I just got a copy of Super Breakout (version 1.1a) from Terminator
and it looks good! My only complaint is that the ball looks 'fuzzy',
ie. its movement is a tad jerky. Does anyone know if there is a
way of fixing this problem? The reason I ask is that the game Bolo
comes with a fix program (something to do with the differences
between European monitors and North American ones) that removes
the jerking motion of the pieces.
Thanx to anyone who can help.

Adele

Actually, I heard about a piece of hardware which has a socket for an IBM keyboard in one end and a MIDI OUT in the other, which you can plug into your ST's MIDI IN port, and with the aid of software, use the keyboard. I don't remember anything else about it though..

Wow... Atari Cheerleaders to the rescue...!

Convince this poor slob to spend his money on the Atari Myth...

Gloss over the fact that there are fewer than 50 active Atari dealers
in the entire U.S.of A... so he can forget local support unless he's
lucky enough to live near one of the surviving Atari dealers..

Smokescreen the fact that most of the large software companies have abandoned
the Atari market as not being worth their effort any longer, due to the games
Atari Corp has played with them...

Vaporize him with mythical tales of the wonderful products Atari is going
to bring out *someday* ... deflect him from buying truly useful computer
systems *TODAY* with lots of vaportales of Atari products to come...

Neglect to tell him that he better learn German as a second language if he
buys into the Atari market, since there's little support for Atari here in
the US...

Forget to mention that Atari Corp has NO credibility left in the "big picture
of the computer marketplace, whether "high powered" computing or "game
machine" entertainment value...

Yeah... "ATARI RAH RAH"... that's the spirit...!

Documentation such as "Hitchhikers Guide to the BIOS", S.A.L.A.D. and all the other info mentioned is available... IF... you join the "fraternity" of Atari developers...

As mentioned here on the net by Atari representatives, Atari Corp doesn't consider most of us to be worth their time or trouble.. (comeon Greg, you read it, I read it, we all read it... don't bother protesting)

Only if you demonstrate your "credibility" by forking out the initiation dues and by meeting the "standards" for an Atari Developer, can you obtain entre into the "inner circle" and learn all that neat inside stuff about Atari computers.. (I dunno.. .is there a "secret handshake" too..?)

If you don't meet the standards, or can't afford the $250 intitiation fee, you can dig through the Abacus books (with all their typos and errors) and pore over back-issues of ST magazines, or try to disassemble the TOS ROMs yourself... (something that is highly discouraged by the Atari reps.. you might learn something they want to sell you...)

Seems funny... a company whose market is in the toilet like Atari's is should, by most rational outlooks, try to encourage as many enthusiastic programmers as possible to work with their systems... to help drag them back into the real world... but no one seems to have ever accused Atari Corp of being rational...

>I would be interested in this possibility,
>does anyone know if this is true, and if so, where 5.0MB extensions
>are available? (in Europe)

Here goes:

Text (my translation..) from ad

"The circuits for 2.5 and 4 MB are ysable on any ST. 520+ (+)
and 1040 types can be expanded to 3, 4.5 and 5 MB, of that
2.5 or 4 MB is main storage (i.e. TOS memory), and the rest is
used as RAM disk. Basically, the MMU and shifter must be socketed,
otherwise the computer must be converted by us. All Mega 1s must be
handled by us. Please state computer type and year of manufacture
when ordering"

(+) The 520+ is a european breed (?) with a full megabyte
installed from Atari.

Price list
empty PCB, 2.5 & 4 MB 259 DM
empty PCB, 3 4.5 & 5 MB 348 DM
RAM to 2.5 MB 744DM
RAM to 4.0 MB 1396DM
RAM to 3.0 MB 823 DM
RAM to 4.5 MB 1478 DM
RAM to 5.0 MB 1478 MB

(I guess that the `RAM to' prices are including PCB.. The price difference
seems to indicate that).

947. STe memory

Newsgroup: comp.sys.atari.st
Date: 1990-07-25 08:40:19 UTC
From: srs@oasis.icl.stc.co.uk
Message-ID: <543@ozz.oasis.icl.stc.co.uk>
Source record: 239524
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi There,

Thanks for the response about having 2.5meg of memory in an STe. The conclusion was that if you boot with 'simmfix', then it would all be available for use with no problems. If you boot without simmfix, the machine will think you have 4meg available (assuming you put the two 1meg chips in the first two slots). Obiously this could be a problem if it tries to access the 1.5meg at the top that doesn't exist. So now I have a new question for you - can anyone tell me how the STe uses the memory it's got - if I got this system, I would be using simmfix on all my 'serious' disks, but things which autoboot (games :-) wouldn't have it. Is this likely to cause a problem?

Please reply be email, I'll summarise to the net.

Thanks

Steve

>1) What is the maximum # of partitions possible?
GEMDOS won't allow you to have more than 16 drives installed at one
time. You can, however, divide your hard disk in as many partitions
as you like - judging from the general scheme. Probably the ATARI
driver is the critical point: I don't know if it can handle more than
16 partitions. Probably yes, but I'd have to look into the source
code to decide.

>2) Can the partition inside an XGM partition have other types than
> GEM and BGM (e.g. MIX). Of course I mean the regular partitions, not
> the links.
Yes, an inside XGM partition entry might have the type MIX or whatever.
Most third-party software that uses hard disk partitions (like other OSses)
cannot read the new ATARI partition scheme completely, so you're
restricted to partitions entries in the root sector of your hard disk.

>1040 ST.
Yes, you should have a blitter. If it's there, you get the blitter
option in the options menu, right. No blitter option - no blitter.
Urge your dealer to get you one.

951. Re: C++ on the ST

Newsgroup: comp.sys.atari.st
Date: 1990-07-25 12:55:53 UTC
From: maba@doitcr.doit.sub.org
Message-ID: <1452@doitcr.doit.sub.org>
Source record: 239511

Has anybody a more or less complete list of C++ compilers implemented on the ST? I am also interessted in the full suppliers address and the prices of the products.

I have heard of GNU C++. Is it a native compiler or only a pre-processor? Where do I get it as fast as possible?

Martin "maba" Backschat

952. Startgem, Replay

Hi,

Two questions:

1. Is there a version of Startgem, or some other similar program that is compatible with the STe?

2. Can anybody give me a run down on the features of Replay 4, and tell me what extra features Replay Pro has? And do you think that Replay Pro is worth the extra money?

Replies by email please, the news is arriving about two weeks late here.

Thanks alot

Steve

>

(Various diatribes and followup messages ignored.)

Hey Greg, Hey Chris,

Whatever you do, don't let anything anyone here says about you stop you from posting to this newsgroup. I for one find your battles vastly entertaining.

There again, I don't pay for the net traffic to our site.

Seriously, folks, let's not get too worked up about this. There's room for both positive and negative sentiments about the ST, Atari, the Tramiels (*especially* the Tramiels) etc. I know I swing from one side to the other according to how the machines I use are behaving today and how frustrating my last encounter with Atari UK was.

What worries me more is that I got only one offsite reply to a previous query about problems with our Mega/HD/Laser systems. (Thanks, Robin of Galadriel.) Either there are fewer knowledgeable people around than I thought, or (more likely) our problems are just too weird. Maybe it's about time to take Ken Badertscher's advice of last year, spread out the chicken blood and dance round the machine. Come to think of it, the problem he suggested that as an answer to (a variant of the 'phantom typist') hasn't gone away yet either.

I'd better stop before I get too firmly into Chris Mauritz mode. :-)

Graham

954. Re: Writing ST floppies on a SUN SparcStation (Need help).

Newsgroup: comp.sys.atari.st
Date: 1990-07-25 14:45:44 UTC
From: colas@avahi.inria.fr
Message-ID: <8523@mirsa.inria.fr>
Source record: 239527
Cross-posted to: comp.sys.atari.st,comp.sys.ibm.pc

My solution to this problem is that I have written small ST programs to
convert to/from floppies made on unix by "tar cfv /dev/floppy ."
into ST disks.

They have no docs, but I could be persuaded to post them if there is enough
interest.

I guess that everybody not interested by this has already killed
this subject, so let's go :)

In article <A90248440@thelake.mn.org>, steve@thelake.mn.org (Steve
Yelvington) writes:
> That is a myth that needs deflating. I don't buy that argument
> against *any* currently available 16-bit computer (except perhaps the
> Apple IIGS, which has been abandoned by its mother).

I made the same bet against the apple IIGS. I had an apple II and seen the
upgrade to the IIGS as a dead end. Want to bet with me on the ST fate?

> The standard
> business applications -- word processing, spreadsheets, database
> management, etc. -- are well covered. (How many word processors do
> you need, anyway?)

Only a good one.
Now for the question: cite one good word processing, spreadsheets, database
for the ST.
LDW power is only lotus-1 compatible, superbase pro is FULL of bugs and even
clumsier to use than appleworks on my apple II, perhaps only wordperfect and
calamus are true professional programs -- but where is word?

> What amazes me is the oddball applications that keep turning up.
> Restaurant ordering systems, point-of-sale terminals (cash
> registers), industrial embroidery machine controllers, telephone
> directory assistance consoles ... I keep hearing about STs in the
> oddest places.

Just because any hacker can whip up in one week some program that will bomb
out just because the disk is write-protected (I've seem this many times) is not
really meaningful.

> Why? Because any brickhead like myself can program them, and good
> programmers can really make them sit up and put on a show. The ST is
> not a hostile environment.

Agreed, the ST is a good hobbyist computer, that's why I bought it, but it IS
hostile to the end user. A tolerable situation for a new computer, it can
be fatal to it if it goes on any longuer than 3 years.

> I just converted a GEM metafile that had been created by Easy-Draw to
> PostScript this afternoon using Pagestream.

My thesis was in French. You do you type accents in Easy-Draw? by hacking...
And at the time, the ps output of publishing partner was really horrible.

> > In my opinion, get a taiwanese 386 PC VGA compatible.
> The original poster likes OS-9 and Motorola assembly language. PC
> clones have their places, but I sure wouldn't inflict them on someone
> with those interests. Crazy memory models, incompatible video modes,
> overpriced software, severe RAM limitations ... who needs it?

I said a 386 !!! -- not a 286!
Problem: this was true when I bought my first ST. Just because your
ST stayed the same for 3 years doesn't mean the other computers didn't evolve!
Look at a 386, this is now a real processor. I agree the 286 was a pile of
shit. Moreover, the competitions for PC peripherals makes them often cheaper
than STs.

> If your
> boss makes you buy one, that's one thing, but for a hobby, why do it
> to yourself?

My main use... games!
Good strategic games or simulations are now made first on PCs...
Good arcade games are made for consoles and perhaps the amiga.
The ST niche is dying for the game enthusiast

As soon as FTL and Bullfrog, the last good quality companies that develop
first on ST/Amiga before PCs will develop first for PCs, my ST will have the
same fate as my good old appleII, yet you see a lot of odball applications
on the appleII still today :)

>all the other info mentioned is available... IF... you join the
>"fraternity" of Atari developers...

All the information in these documents is also available from 3rd party documentation. A list was posted a short while ago. I'm sure you remember this, Bob, since you think you know so much about the Atari market.

>As mentioned here on the net by Atari representatives, Atari Corp doesn't
>consider most of us to be worth their time or trouble.. (comeon Greg, you
>read it, I read it, we all read it... don't bother protesting)

Yeah, but I didn't misinterpret it. While I would prefer "official" docs, the 3rd party docs were good enough for the programming that I did on the ST. What have you written for your ST, Bob? What's your *professional* opinion on the 3rd party docs you can buy? Or have you never looked at them? Oh, you don't program. Ah.

Whining like you do will only insure that the Atari people never post, because if they do you'll whine about it for years.

Ok, I'm not sure I like being called an Atari cheerleader, but I still think the Atari ST is a decent choice for a home computer. And that's based very firmly on what can be bought today. NO allowances for what's promised. But that's not the main issue here.

I live in the Chicago area. We have, as Atari dealers, Computer Cellar, two branches of Software Plus, a couple of 'sorta' atari dealers (Mars Merchandising and Computer Grove) and one more I never remember the name of. A game store, 'Gamers Paradise' can special order Atari Stuff. At least 4 other operations- Apple Annie (I kid you not), Kolputer Systems, F&D and(please forgive me if you're reading this, Gerry--I forget the name of your business) handle Atari software and accessories. And I am absolutely certain this list isn't complete. Makes me wonder if Atari dealers are all THAT scarce.

Now it happens that I know megabyte (the fella who asked the original question). He lives in the DC area. Anyone read 'Current Notes'? I don't think he'll be hurting for local support if he picks an ST.

Steve J.

Wow... Atari Naysayers on the scene!

Convince this poor inquisitive fellow that Atari computers are worthless...

Ignore the possibility that any local dealer exists near this person (I have three near me)... Don't even mention the availabilty of mail order...

Forget the many useful programs already available for desktop publishing, programming, word processing... Go ahead and lump all the current software publishers in the ST market into the "minor company" category...

Brainwash him with tales of vaporous products never seeing the light of day... Ignore the fact that his original query dealt with the 1040 ST, a solid product for several years, being replaced now with the non-vapor STE line...

Don't admit the possibility that anyone currently living in the continental United States has any remote interest in the ST (including yourself, writing

that dispassionate, disinterested posting)...

Absolutely DO mention that Atari the corporation has no credibility left.
However, attribute this opinion to the entire computer market, rather
than being your own feelings.

Yeah... "Atari BOO HISS"... That's the productive way to spend the day!

:)

>
> Not trying to start a flame war [...]
>
> DOS machines: ick. Unfortunately, they're cheap and popular, and
>will continue to be far into the future (ugh).
>

I'm not trying to start a flame war either, but why are PC's still called "DOS machines"? Why can't you face the fact that Intel-based PC's are no longer DOS machines, but rather "industry-standard personal computers" capable of running DOS as well as many other operating systems? You applaud Commodore for providing UNIX for the Amiga, so I assume you want to run UNIX on a personal computer. UNIX has been available for Intel (286/386/486) PC's for many years, with many versions available (Xenix, SysVR3, AIX, QNX), and more about to appear (SysVR4, BSD4.4, Mach). And still you loathe PC's.

OK, it's true that in their standard configuration, Intel-based PC's have pitiful sound capabilities when compared with Atari's ST/STE/TT and the Commodore Amiga.

As far as graphics is concerned, my $92 SuperVGA card provides better graphics than the upcoming TT -- 800x600 w/256 colors, 1024x768 w/16 colors -- with a 256K-color palette. A $200 SuperVGA card will do 1024x768 w/256 colors. Beyond that, of course, there are graphics controllers with dedicated coprocessors for those who feel the need.

That's the whole point I'm trying to make. When you buy a PC, you're getting the industry standard. That means you can tailor your PC to use ANY graphics standard, ANY disk interface standard, ANY peripheral interface standard, ANY network standard, etc., and at this point, it costs less to get a PC than a comparable Amiga or a TT.

Of course, you just may not like the Intel processor, or it may be something else about the current architecture of industry-standard computers that just doesn't agree with you. That's your opinion, and that's your right. But really, none of your animosity ("ugh", "ick", etc.) makes any sense.

Sorry to ramble like this; I'm just trying to understand.

From: n8742883@unicorn.WWU.EDU
Message-ID: <1252@unicorn.WWU.EDU>
Source record: 239532

I've been playing with my NeoDesk v 2.0 program, and will soon be buying a hard drive. I plan on having NeoDesk boot up with a picture in the background (I usually don't put a picture in the background when booting off of my sole floppy; takes too much time)

Anyway, I was wondering if there are any sites having medium and high rez pictures out there. I've looked through terminator, and haven't found much there (unless I'm missing something in some subdirectory?....)

If anyone could send me a site with pd Neochrome or Degas pics in medium or high rez, I would be very grateful.

Thanx in advance,

Perry Pederson

Source record: 239535
Cross-posted to: comp.sys.atari.st,comp.sys.ibm.pc.misc

I'm just writing a set of prgs. that'll do that:
read, write atari st floppys on unix machines
Also included are utilities to show the bootsector, directory and fat.
What you need for it is basically a UNIX machine that has a 3 1/2 inch
floppydrive and is capable of formatting floppys for the PC/XT 3 1/2 inch
DS, 80 tracks, 9 sectors.

The programs are in a raw state, that means they are running,
but are not documented, not fully tested and will ocasionally dump core
when confronted with yet another new situation. AND I WILL
NOT GIVE OUT COPYS BEFORE I CONSIDER THEM READY FOR BETA TEST.
UNDER NO CIRCUMSTANCES.

I'm not sure how I will make them available (shareware ? public domain ?
freeware ?), but I'll decide the next couple of weeks.

The set should be ready in about one to two months (depending on how
often my wife lets me switch on power on my computer :-)).

Hope that helps

Stefan

^^^^^^^^^^^^^^^^^^
Oh dear, that's too bad.

>it is also surface mounted.
^^^^^^^^^^^^^^^^^^^
Tough luck all round then.

>If you're paying anywhere _near_ $100 for a 16MHz '881 or '882, you might
>consider changing your store. I would imagine that Motorola isn't making
>many '881s these days, and I did hear that '882s are much easier to make
>than '881s in speeds of 25MHz on up.

Well under $100 eh? Well that will make for a cheap TT upgrade for
those who want it.

>Dave Haynie Commodore-Amiga (Amiga 3000) "The Crew That Never Rests"

I am inclined to agree that while I don't have a TT under my
finger-tips, this discussion it pretty hyperthetical.

However, as far as NZ goes - the TT's are apparantly on the ship and
days away from the store. Yet there is still _no_ sign of the A3000...

Aaron.

Hmm, perhaps you could tell that to the ten people I know who have bought
A3000's last month and have them at home!

Just because the A3000 hasn't made it to the shores of New Zealand doesn't mean
that it's vaporware; it is in stores and available now in other parts of the
world--like Canada and the US.

A friend of mine (and mutual ST-user) asked me to send him a message via
the Newsgroup because his site's mail system is kaput. My apologies to
all.

(Hit 'n' now...)

James,

Well, here is the message you requested. Try 'R'eplying directly to see
if we can get linked back up.

Regards,

--

I don't know if you can use that sort of rational logic when dealing with our favorite company. One must only be reminded that 6 EPROMS (masked ROMS are even cheaper) to hold the TOS 1.4 OS "upgrade" cost about $40. Isn't Atari selling the chips for $100 and then you have to PAY someone else to install them? If you use Atari logic on the 68882 cost schedule, you'll see that the price may be a little higher than you'd imagined.

I know...I know...a few whippersnappers are going to say you can install the things yourself and save on the installation costs. I don't think this can be expected of the typical computer user so I'm assuming he/she would bring the unit in to the local Maytag repairman to get the work done. :-)

>Galadriel.) Either there are fewer knowledgeable people around than I
>thought, or (more likely) our problems are just too weird.

I have noticed what might be a third possibility: fewer people seem to
be posting to this newsgroup than in the past. I've been following this
newsgroup off and on for the last 4 years (ever since I bought my 1040ST
in 1986.) Back then, it seemed that there were never less than 50 new
messages each time I logged in (on a daily basis)...there were usually
quite a few more messages in c.s.a.s than there were in the Amiga
newsgroup (admittedly, a contributing factor being frequent posts by
Amiga users preaching the virtues of the Amiga vs. the vices of the ST :-)

These days, there is more traffic in the Amiga group (and even more
in comp.windows.x :-) than there is here. What's more, there tend to
be more technical "discussions" (ie. question-answer posts) in other
newsgroups.

So what's my point? I don't know. There seems to be a relationship
between the success of a product and the number of postings in the
newsgroup relating to that product. I do not think Atari Corp. is in
trouble (what do you expect me to say - I own lots of Atari shares ;-(
but I do think that the ST line is closing in on obsolescence. What
is going to keep Atari alive, in the near future, are continuing sales
in Europe and Lynx/Portfolio/whatever else Atari sells here in the US.

In the long term...I don't know. Atari had a great chance to be a big
player when it initially developed (well, Perihelion, I guess) the
Abaq/ATW/Transputer. The machine, for which I had seen some initial
specs in 1987(?) was great for its time. Had Atari managed to market/produce
this machine on a grand scale, I believe Atari could have broken into
the very lucrative workstation market. Now, it is 1990 and we're waiting
for the TT to appear - a machine that is in EVERY WAY inferior to the
1987 ATW (from the specs I've seen on the net.) Not only that, some would
argue that the TT is in some ways inferior to any ole' '386 clone with
Super VGA and large capacity hard-disk......but I don't BLAME Atari
for having chosen the path they did. It is always easy to look at a
situation in retrospect and say "you should've done this and this and this..."
I'm sure Atari Corp. (or at least the Tramiels) had their reasons. If
personal greed or short-term profits were among them, even that would be
excusable - after all, we live in a capitalist society.

On a different subject....
Personally, I'm a Sun Sparcstation convert. Can't afford one (yet), but
if I had $10,000, that would be the machine to get. No PCs provide as much
hardware _and_ software (operating system and development tools) for the
money ('486s and the Mac IIfx don't even come close)...and for a bonus,
you get a product that is supported not only by a reputable company
but by nearly every major university in the country :-)

Well, I've rambled on for long enough. 12:30 is close at hand and I don't
want to miss Dave's Top 10 :-)

Tom

Whippersnapper speaking here:

1.) I thought $100 included installation of TOS 1.4 if you wanted it.

2.) Who said you had to buy the co-processor from Atari? Look in your _Computer Shopper_, find a place that sells it for under $100, buy it, unsocket the 68881 and put the 68882 in the socket.

(Or you could goto your local Maytag repairman and get it done. But I thought nobody ever visited the Maytag repairman :-)

Colas Nahaboo says:
>As soon as FTL and Bullfrog, the last good quality companies that develop
>first on ST/Amiga before PCs will develop first for PCs, my ST will have the
>same fate as my good old appleII, yet you see a lot of odball applications
>on the appleII still today :)

Dunno about Bullfrog, but FTL is ready to release Dungeon Master on the IBM PC this Fall/Xmas, with a FREE DAC converter plug to give high-quality sound, and a Mac version of Dungeon Master is close...

So what, you say...? Lots of companies port their software to other machines.. Well, FTL is going to be developing *NEW* products exclusively on the Mac...

They like the ST, but what are you going to do when the "parent" company of the hardware jerks the market around..

For me, this means I have to buy a Macintosh if I want to develop new games with them, and contrary to what the cheerleaders around here think, I like my ST better than anything else I've ever used... but "business is business"

At the risk of exceeding my allotted number of replies in the Atari
universe, Greg Lindhal says:

>>Documentation such as "Hitchhikers Guide to the BIOS", S.A.L.A.D. and
>>all the other info mentioned is available... IF... you join the
>>"fraternity" of Atari developers...

>All the information in these documents is also available from 3rd
>party documentation.

Golly.. if you know anyone pirating this exclusive "non-disclosure" Atari
information, you'd better turn them in to John Townsend at Atari..

John and Allan have been pretty specific that Atari doesn't tolerate
anyone distributing their "proprietary" information...

Not unless you *buy* their info, that is...

As far as my "professional opinion" on documentation, I have most of the
Abacus series of books (have you noticed how virtually NO bookstores carry
these Atari books anymore, Greg? They must allll be Atari Bashers.. eh?)

I also have Mark Williams C, which is pretty well recognized as being better
documentation than most of what Atari Corp puts out.. but.. .Mark Williams
has announced that they're not going to waste any more of their time on
a backwater market like Atari...

My software company used to support the Atari 8-bit computer.. any
particular reason I should continue to lose money supporting the ST..?
Does your *personally owned* company support the ST...?

Ask Jim Allen of FaST Technologies, or Frank Cohen of Regent Software,
or Mark Sloatman of Practical Peripherials, or... (you get the idea..?)

It's hard to feed your family on the *promises* of Atari Corp...

(How about you.., eh, Greg..? You have to feed yourself on the vapor
put out by Atari Corp..? I thought not...)

Try living in the REAL world of Atari Computers for a while... you'll
find it's not as much fun as posting "Rah Rah Atari" messages on UseNet..

Awfully wrong. The Amiga 3000 ships since end of June, even here in
Germany. The TT won't ship before September because the 32 MHz version
will be on display first at the Duesseldorf ATARI fair, August, 24-26.

You just cannot win this mission. You have to win the previous one, that is,
make the Berzeker "flee" after saying something like "you have annoyed
me, I shall
pursue you". If the base call you back, you have lost.
To "win", you have to hit it fast and hard, expending all your weapons soon.
To destroy it, you will have to find something else, however. That's for
another
mission.

981. TeX 3.0/LaTeX for Atari ST sought

Newsgroup: comp.sys.atari.st
Date: 1990-07-26 12:53:33 UTC
From: wwm@pmsmam.uucp
Message-ID: <1990Jul26.125333.11879@pmsmam.uucp>
Source record: 239545
Cross-posted to: comp.text.tex,comp.sys.atari.st

Does anyone know where I can obtain a 'complete' TeX/LaTeX (based on TeX 3.0)
for the Atari ST? By complete I mean:
* TeX 3.0
* LaTeX
* BIBTeX
* DVI for Seikosha SL80AI 24-pin dot-matrix (Epson LQ-800 clone)
* Monochrome DVI previewer
* Metafont
* Appropriate fonts
* DVI2PS (latest)
* PS fonts (?)

I don't want much, do I :-)

My preference is for 3.0 but ....

I would happily pay a REASONABLE price to someone for DS floppies as opposed
to having to obtain the stuff by networking but I can handle anonymous UUCP
(Telebit T2500 on this end) and could get a friend to FTP off an Internet
archive (but only if I absolutely HAVE to).

Please respond by e-mail since I don't read this group often.

Sorry if this falls under the 'Frequently Asked Questions' category. In
any event, THANKS for taking the time to read this!!!!!

Yesterday I listed the Atari-ST-oriented dealers in the Chicago area. My friend Gerry Feid will be upset if I don't mention that his business is called CSA Ltd.

I also forgot to mention at least one more 'sorta' Atari dealer. Roselle Music hosts meetings of a MIDI interest group, and can order STs through one of the regular dealers.

Message-ID: <546@ozz.oasis.icl.stc.co.uk>
Source record: 239549
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi There,

Thanks again for the response about the memory in an STe. The conclusion reached was that if you had 2.5meg with the 2 1meg chips in the high priority slots, then you could boot with simmfix to get a 2.5meg machine. If you booted without simmfix, the STe would think there was 4meg available. This would cause big problems because the video memory is always allocated from the high end of RAM. I was thinking about this last night and came up with a possible solution: If you had the 2 1/4meg chips in the high priority slots and booted without simmfix, then the STe would think there was 1meg available, which is ample for all the autobooting software I can think of. Booting with simmfix would still give 2.5meg. What I would like to know is, would this method work? I can see two possible problems:

1. The STe would be trying to access the two 1meg chips thinking that they were 1/4meg chips - what would happen?

2. Does it matter what order the chips are in for simmfix to work?

Any response on this would be much appreciated, preferably by mail since the news is very slow getting here. Could some kind soul also mail me a copy of simmfix, since it doesn't appear to be at terminator. Oh, sorry, its called something else now isn't it. Shame, I thought Terminator was quite cute :-)

Thanks alot

Steve

Well, I live in the largest city in these here United States. :-) As far
as I can tell, ST software is significantly harder to find now in NYC than
it was when I bought my ST a few years ago. I can only think of one or
two places that have any decent selection of titles. The exception is, of
course, MIDI software. Several large music stores have STs displayed and
have a decent amount of MIDI titles in stock.
```

The only seller of ST's that comes to mind other than the music stores is
J&R Music World, a big mail order outfit with a showroom near Wall St.
However, the ST's on display have been broken for ages. I don't think I've
seen them turned on in months and I don't ever recall seeing mice attached
so that a customer could try it out. Not that it matters, since they are
in a rather dark corner behind a brighly lit and active Amiga display.

If this is the kind of marketing we can look forward to in a major
city like New York....draw your own conclusions.

>
>Now it happens that I know megabyte (the fella who asked the original question).

Yep, I've heard there is a very active user group base in that area and a few
stores that deal in ST wares as well.

>

Assuming the specs yoiu've read are correct, and the TT really has a socket. Assuming Atari doesn't go to surface-mounting in Rev N+1 of the motherboard to save 25 cents per box. Assuming the TT ever ships. Assuming, assuming, assuming -- we're all assuming much about the TT. The A3000 is a bit more assumption-free; it actually exists.

You *DON'T* need StartGem on the STe, since the STe has TOS 1.6,
which can autolaunch GEM-applications itself.

Some of us don't take the attitude "Why make life easy when IBM can make it
almost imposible for you?" I would rather have an Atari st TT or amiga than the
PC compataible I have to suffer at home at the moment (though now with minix).

Intel tried to do too much before they new for certain what was usefull and
what was not, hence brain dammage such as 64k segments, lack of interrupt requests etc.
The 68000 series, amongst other processor series, does not suffer from such handicaps,
as Motorola thought before burning a design into silicon. I use 68030 unix at
work, minix or os9 at home (on a friends atari 520). If I had the cash I
would have a TT (in a more practical box, of course)

Look,

- We all know that Atari's U.S. marketing has lots-o-room for improvement.
- We all know that the "A3000 is shipping now, but the TT is vaporware."
- We all know how difficult it is to get techical docs on the Atari.
- We all know Atari stocks could be doing better.

Do we have to post about all of these things multiple times on a daily basis? Anyone who hates Atari machines and Atari Corp. or just wants to flame should look up the usage of the 'u' key and then use it, you WON'T be missed. People that use this newsgroup do so to discuss how to better utilize their Atari computers, not to participate in flame wars. If you've have a rough childhood and feel the need to spew negative filth on everyone, try alt.flame.

I rang Evesham Micros up a few days ago about this memory board, and was
told that it would be available in "two to three weeks".
The price I saw quoted for the unpopulated board was 60 pounds, and for the
fuly-populated (4 meg) board 340 pounds.

Source record: 239562

OK, here's the bottom line on the flame war. IT IS EXPENSIVE! E-mail
is cheaper and quicker.
1.) I want to know about Atari (this is an example).
2.) I post to c.s.atari.st asking for e-mail responses.
3.) You e-mail to me and don't waste lots of money that isn't yours...
4.) Anyone else who wants the info at around the same time I do send
me e-mail and I reply by e-mail.
[NOTE: If have absolutely no idea what kind of computer to look at, I
ask for a short summary of each computer from the propernews-group
andcarry off into e-mail.

All the computers being bashed in this war EXIST. Stop bashing them
and make things happen for them.

If you feel the childish need to flame me on this, I'll just delete
you e-mail message...

A couple of days ago I posted a message concerning a story I had from my parents who were ordering TC 2.0 for me. The story was that TC 3.0 should be shipping in a matter of weeks.

As it turns out, this is only true if you have a PC (as opposed to an ST). It was a case of not-very-computer-literate parents talking to a sales rep who assumed that `delayed 2.0 delivery' just _had_ to mean PC without bothering to check the license number. As a matter of fact, the 2.0 upgrade must already have been in the mail when this conversation took place...

Sorry for starting bad rumors.

Re: Time for a New Computer...

I myself, was wondering whether it was time to bail on Atari and get something different. The one and only reason for this concern was future compatibility. Some day I'll want new hardware, and when that day comes, what will I do with my data bases, drawings, documents, etc???? You see, I'm not a member of the program-a-month club: I don't need new/wizzy programs every week to keep me happy. I do need solid applications with a guaranteed future.

After some rational thought, I find the Atari still satisfies, for the programs I need. Here's a list:

* For drawing technical diagrams and construction plans, I use EasyDraw by Migraph. It's a great program, I really like it! Migraph is porting EasyDraw to the PC. I suspect it will be ported to the Mac someday as well. I also guess that TouchUp will not be far behind. BTW, an update for the Atari is in the works, according to Migraph's last newsletter.

* As I recently posted, I am starting to use SuperBase Personal II. It seems to be a fine database (still learning it) and it's available for the PC, the Mac, and the Amiga! It is also capable of many import/export formats, including dBase and Lotus.

* For spreadsheets, I use LDW Power. It is compatible with Lotus and I have ported spreadsheets back and forth between a PC and my Atari with minimal pain. When used in conjunction with Turbo ST 1.8, LDW is quite snappy!

* For word processing, well, I still use First Word Plus. I don't think is compatible with anything else, but I can always reduce a FWP doc to an ASCII file. I plan to get WordPerfect sometime soon, as I understand they support other the Atari well and the program is available on the PC.

That's it for my applications. Everything I'm interested has good upgrade potential to other platforms. No need to panic and change computers; I'm covered! PS: these applications cost me considerably less than equivalents on the PC or Mac would have!

As for games: I'm not a big gamer, but I have fun with Flight Simulator II and Dungeon Master. If I ever finish DM, There's Chaos Strikes Back :-). I dunno, I don't have an insatiable appetite for new games and it seems to me that anyone but the most avid gamer can keep busy for a long time with existing titles.

Then, there's ease of use. I find that Neodesk, UIS III, and G+Plus (all accelerated by Turbo ST) make for a GREAT user environment. After using a UNIX machine all day long at work, this is a very refreshing environment!

These utilities continue to receive solid support.

And hey, by the way: I also find that Mark Williams C is a decent C-compiler, especially when teamed with Gulam and Micro-Emacs 1.10. The MWC docs are good enough so I can putz around without becoming a developer. I intend to get GCC one of these days and give it a whirl.

Not to mention that there's some decent telecomm programs (Interlink for one) and back-up utilities (DiamondBack for one).

Jeez, I have more stuff on my Atari than I have time to use.

These are my personal opinions. I'm not connected with any of the companies or productds mentioned, other than being a satisfied customer!

Message-ID: <1921@gmuvax2.gmu.edu>
Source record: 239567

Well, sorry to bother you all with this, but seeing as this is the only group I read that is really relevant to this...

I've been spending a LOT of time working with the computers here at school and at home (1040ST :) , and my eyes are killing me! What could be causing this, and how could I correct it?

I don't think I need glasses, because I can see fine (nothing blurry when I focus), however I sometimes have difficulty actually moving my eyes so I can focus--I have to actively concentrate on focusing! Ugg! also, my eyes tend to ache chronically. I've developed a few, mild headaches, which feel like motion sickness headaches.

Has anyone else had such problems? Should I go to my doctor, or is this some common affliction, which is easily correctable? A friend of mine said that it could be caused by beta-rays from the monitors...sounds like a distinct possibility to me. Anyone? Help?

998. Re: (yet again..) "DOS machines" (Was: TT (Who has one?))

Newsgroup: comp.sys.atari.st
Date: 1990-07-26 21:04:16 UTC
From: n8742883@unicorn.WWU.EDU
Message-ID: <1257@unicorn.WWU.EDU>
Source record: 239568

Since people are haggling back and forth comparing different computers
to each other, I think I'll flame my 2 bits here....

I bought a 1040ST three years ago with the full knowledge that
it would be "obsolete" sooner or later by other people's standards.
My friends all have Macs, and I've recieved nothing but criticism from
them for buying a "game machine" and all I hear is Mac propoganda and
how stupid I was to buy an obsolete machine.

I keep pointing out to my friends that a machine isn't
obsolete until it can't do what you want it to do-- it doesn't matter
(to me) if there is a machine that is faster, a machine with more
colors, more pixels/inch, more sounds, better CPU, more companies
spewing out software, etc. etc.

My computer is used for programming in modula-2, C, and LISP.
I do a lot of telecommunicating to the mainframe at my university, and
I have two word processors which suit my needs perfectly. Of course,
I play games on my computer as well. I could do the exact same thing
with a Mac, or an IBM, or an Apple II, for that matter. As long as
the computer does all that I want it to, it's not obsolete. My
friends feel that a bigger-faster-more-memory-and-graphics-machine
makes any machine with lesser abilities totally obsolete, which is an
underlying attitude that I feel coming from some people who are
complaining about how awful Ataris are. I don't care much about the
STe, or any other computer for that matter because I am satisfied with
the system that I have and what I can do with it. The moment I am
dissatisfied, I'll start looking to buy a new computer.....

Well, time to get off this soapbox here. Just wanted to use
the 1st amendment to spout off my feelings on this whole matter....

P.S. If anyone wants to sell a mono monotor, drop me a line!

Perry Pederson n8742883@unicorn.WWU.EDU

colas@avahi.inria.fr (Colas Nahaboo) writes:

[... reply to question on upgrade from CoCo3 to Atari ST ...]

>In my opinion, get a taiwanese 386 PC VGA compatible. That's the route I will
>follow as soon as they will cost less than the price I payed my first ST,
>about $1500 (now you have a 286 for this price). I had STs for the past three
>years, enjoyed them, but their time is counted... The amiga may survive since
>it has a credible successor with the A3000, but it is much more expensive than
>PC-compatibles for non professional graphic uses.

Speaking from Melbourne, Commodore dealers have reduced the price of
a 68020 upgrade for the Amiga 2000 by as much as a third in
anticipation of the Amiga 3000. It is now possible to get an Amiga
with as much grunt as a 386 VGA machine with windowing software.
(NO! No wars here! If you want to dissuade me, send email!)

As an aside: have you noticed that when people compare IBM-clones
with either the Atari ST or Amigas, they thoughtfully neglect to
mention how much it costs to get a mouse, windowing software, a fast
graphics card, an operating system that multitasks, and enough memory
to get it working? My impression is that buying a IBM-clone with all
the add-ons and legitimate software would cost more than an
equivalent Amiga or ST.

Second aside: I read a rather biased article in some so-called
professional magazine (it was so biased I forgot the title) about
animation on the Apple Mac. It started with the writer wondering why
the Mac couldn't do colour animation like the Amigas, and ended with
a recommendation to buy a 24-bit colour card for the Mac II. That
writer (again, thoughtfully) forgot to mention how much such a colour
card would cost, and concluded by saying that Mac users now had the
same opportunities as Amiga users in doing animation.

Solid? Depends, I dont drop computers. Vaporous products? We all know that tale all to well thank you.

>Don't admit the possibility that anyone currently living in the continental
>United States has any remote interest in the ST (including yourself, writing
>that dispassionate, disinterested posting)...

You hit it exact... Remote. Increasingly so.

>Absolutely DO mention that Atari the corporation has no credibility left.
>However, attribute this opinion to the entire computer market, rather
>than being your own feelings.

How true. I developed on the ST from day one. My mis-fortune. And, literally mean fortune. Least $$$ I've ever made w/ a machine, includin' the TRS-80 model 1. Bad software Maybe? No, try Deskcart! (rated as the best add on product for the ST on multiple occasions in multiple publications). Sad indeed.. I wont say what I made on Deskcart!, it's embaressin'. Nuff' to say a pal wrote a text editor (2nd program he EVER wrote) on a PC clone at made more shareware than I did commercially. (sad!). The credibility is gone

(in my mind and computerdom). Another program I wrote, PRINT-IT! never went
to market, and, in alpha/beta testing was on pirate BBS's. I'm impressed!
I made $0.00 on that one, as, after this happened it was decided that
an estimated 40-50% of ST users had it already. This is where I DROPPED
the ST (I still have my machine though, could'nt get nuff' $$$ sellin' it).
The bottom line of the whole mish-mosh is should we again buy atari?
I sure won't, The PC's are more powerful/affordable/supportable/expandable
installable/workable/useable/available/fixable/likeable.

>
>Do *YOU* feel comfortable lying to someone, and telling them that everything
>in the Atari universe is just rosy...?
>

Lets all face it. Knowone likes to admit, "I made a bad purchase".
I show you McPeople in countless numbers that can almost be considered a
religion. Atari owners are like this. PC owners just dont care, while we're
argue'n, their using their computers for something useful. Inferior
as stated above, is a poor choice of wording, since if it does the job
for the purchaser its not inferior. As for the atari universe, I beleive
I've hit the nail on the head. Think about it, the atari ST was a SUPER!
buy in its day. The Lynx makes the Lameboy Nintendo look silly. Atari
does grandly in europe. Put two and two together. Maybe? Atari US does NOT!
want to make money. Or, maybe they want to write off losses? Or maybe it's
the parent organization of atari UK/Canada and cant let the US parent
go belly up (ie: we'll goat consumers into purchasers, or worse yet,
promise OLD atari users items never intended to get to them).
After all.... If one market does well, another should at worst do
moderately (at least in the computer area). Think about it a bit will ya'll.

MILD FLAME ON

Of course you don't see any problem with it. Your own posts are much more inciteful than the one Greg repsonded to. I agree with Greg that the post was somewhat lopsided (written from a power-user point of view). I, personally, am glad to see Greg's postings. Many of us are happy with our STs and prefer them to various other systems for various reasons. Greg represents a group of people who often don't have net access, and I for one appreciate it.

I tend to call 'em DOS machines or 8086 boxes. (Or pieces of *Shit* but that's not important right now... }-)

I object to corporations like IBM taking generic language and turning it into trademark status nomenclature. Used to be "PC" meant any personal computer. The IBM PC wasn't even personable, let alone personal, at its introduction, and has only slightly improved since. Nowadays you don't hear people saying "personal computer" very much. I tend to say "micros," "minis," "mainframes," and "supers." If you want to talk about generic microcomputers, you can't say "PC" any more. (Very sharp of IBM's marketing staff, I must say. But just 'cause it was obviously a smart move doesn't mean I have to like it. Just like Sun calling their dreg of a system NFS. How generic-sounding. Bah...)

>longer DOS machines, but rather "industry-standard personal computers"

They are not personal computers in the sense that I'm used to. They're simply members of a long line of Mediocre Business Machines. Business Machines aren't personal in my book. Industry standard PC is an oxymoron.

>capable of running DOS as well as many other operating systems? You applaud
>Commodore for providing UNIX for the Amiga, so I assume you want to run
>UNIX on a personal computer. UNIX has been available for Intel (286/386/486)
>PC's for many years, with many versions available (Xenix, SysVR3, AIX, QNX),
>and more about to appear (SysVR4, BSD4.4, Mach). And still you loathe PC's.

Pretty much. I personally loathe current Intel chips. I don't care what you can do with one, a different architecture can do it better.

>OK, it's true that in their standard configuration, Intel-based PC's have
>pitiful sound capabilities when compared with Atari's ST/STE/TT and the
>Commodore Amiga.

In their standard configuration IBMPCs are useless. In their standard configuration IBMPCs boot up into Cassette BASIC and don't even have cassette ports (any more, recently, you know what I mean.). And no graphics functions at all. In a standard ST or Amiga configuration, you have a complete system right out of the box. With no need for MultiFUnction I/O RAM Expansion cards, monitor adapters with parallel ports, funky disk controller cards, bus adapter cards, etc. etc... The ST loses in that you can't get anything *but* the standard configuration, but the standard is still very useful in its own right.
>
>As far as graphics is concerned, my $92 SuperVGA card provides better graphics

>than the upcoming TT -- 800x600 w/256 colors, 1024x768 w/16 colors -- with a
>256K-color palette. A $200 SuperVGA card will do 1024x768 w/256 colors.
>Beyond that, of course, there are graphics controllers with dedicated
>coprocessors for those who feel the need.

I think there's more to the TT than meets the eye. Why do they specify up to 8 megabytes of video memory with the meager selection of graphics modes they're offering? 8 megabytes is enough for a 1024x1024 8 bitplane deep (256 color) image. I bet you could find at least a half dozen VMEbus cards that'll be happy to use that address space for you.

And while I've seen wonderful still-images on VGA and Super-VGA systems, I've yet to see a game worth looking at on one. Even games that support EGA, with its 16 color palette, look like they came from a Vic-20. Now while games may not seem all that important to you, they are certainly an important part of a Personal Computer's functions, and there are a lot of companies out there charging lots of $$$ for their so-called graphics games. Business graphics don't need more than EGA resolution. CAD needs resolution, but number of colors is really no big deal. For the kinds of detailed work you tend to see on a CAD system, color gets to be more of a distraction as the level of detail increases.
>
>That's the whole point I'm trying to make. When you buy a PC, you're getting
>the industry standard. That means you can tailor your PC to use ANY graphics
>standard, ANY disk interface standard, ANY peripheral interface standard,
>ANY network standard, etc., and at this point, it costs less to get a PC
>than a comparable Amiga or a TT.

Just because it's a standard doesn't mean it has any technical merit. Look at IBM mainframes - they're pretty much the standard in the mainframe market. Look at their price/performance ratio. Look at IBM operating systems. They're the standard in the IBM mainframe world. They haven't evolved more than a few ticks in the technology scale, compared to what's being done with microprocessors and workstations. You still have to allocate physical disk blocks in CMS, there's still no real filesystem. The technology is utterly atrocious, but it's a standard. Of course, in the case of mainframes, you still can't get *ANY* graphics standard, or *ANY* disk interface, or ......

It's too bad it takes so *damn much* iron to make a mainframe, otherwise the clone market there might be a little hotter... }-)

But back to the topic... Why would I want to *use* "ANY" standard? I just need to use a couple of the good ones, and I'll be happy. The STs have standard serial and parallel ports, that's good. Atari cut too much of a corner with their CSI, but it's a small matter to get real SCSI. That's good. From SCSI you can get anywhere, and that's enough. SCSI ethernet, no problem. SCSI video, it's been done. SCSI anything - no problem. Don't need IBM's idea of a standard, to be Standards Compatible.
>
>Of course, you just may not like the Intel processor, or it may be something
>else about the current architecture of industry-standard computers that just
>doesn't agree with you. That's your opinion, and that's your right. But

>really, none of your animosity ("ugh", "ick", etc.) makes any sense.

I suppose animosity is a little unreasonable, but it's definitely genuine
distaste. And from there, it's easy to get carried away... (LIke I just
did, writing this silly article. sigh...)
>
>Sorry to ramble like this; I'm just trying to understand.
>
>-- Jerry

Well, how's this - there are two kinds of computer users in the world - those
who care about 'em and those who don't. You're probably one who doesn't, and
I'm one who does. Not caring about 'em doesn't mean you don't like them, just
that they're not a major factor in your world view... And obviously people
like me, who write huge responses to simple questions, well... you get the idea.

>Awfully wrong. The Amiga 3000 ships since end of June, even here in
>Germany. The TT won't ship before September because the 32 MHz version
^^^^^^^
Maybe, but that IS NOT true in NEW ZEALAND. The closest you can get
to an A3000 is an avertising pamplet. There is one prototype A3000
that has been on display at two computer shows here in NZ, but that
it all. We still have no idea of a price.

Apparantly there is plenty of demand, but no supply. Some
documentation problems were mentioned - I don't know. Basically;

Commodore: - No comment
Commodore dealers: - No idea
- Don't ask us
- Soon
- Here, have a pamplet
- Christmas?

New Zealand is a but funny - we get Commodore stuff _after_
everyone else, but Atari stuff _before_ everyone else.
Examples of the first would be: the A2000, A2500, and A3000
Examples of the later would be: the STE, Lynx, Megafile44, and
apparently - the TT (32)

(Of course other things - like the ATW, we don't get at all!)

>will be on display first at the Duesseldorf ATARI fair, August, 24-26.

I must say though, that I would be suprised if NZ had any 32Mhz
TT's for sale before Germany - I guess time will tell.

>Just where did they post that public domain schematic capture program? Maybe
>comp.source.when.hell.freezes.over? Yeah, that's the ticket. The same place
>they posted the PD clone of PageStream....

My wording was a bit ambiguous, I guess. I meant "program" in the sense of "technical support program", hot-line, software support, etc. I'd also require one thing in particular - source code for everything. I don't think this is a problem, to me, personally. I thought I conveyed that in my first posting, as well, that I was speaking only for myself. I hack on Unix kernels, and have a lot of fun doing so. I don't need technical support from my system vendors, I just need a source tape.

Sort of going back to Dave Beckemeyer's comment as well. Yeah, I'm a hobbyist, I like to mess with computers. I'm pretty fortunate because I've got a good paying job to do pretty much the same thing. So, yeah, my computers are just toys for me. I was only speaking for myself anyway, y'know?

As for "real programs" ... You can get Macsyma free from the Department of Energy. The Free Software Foundation puts out stuff that's way ahead of the "equivalent" commercial offerings. TeX is free for most systems, including Unix. There are, of course, "value added" commercial versions of TeX and Macsyma, but in my opinion (again, I'm just speaking for myself, OK?) they don't offer much extra. I'm not into publishing or design, so none of those issues bother me.

As a techno-geek I don't feel that the question is valid. If you want a program but you don't want to pay $$ for it, then write it. It's kind of nice to have a system that a lot of other people are developing for, but it's no big deal to me. I don't have time to even glance at more than a few percent of the results anyway. If Atari were to close up shop tonight I would still tool along on my ST, same as I've been so far.

Either they're in the store, or they aren't. Unless, perhaps, you're thinking of Schrodinger's TT.

I haven't been to NZ to check out your stores, but A3000s have been selling since mid-June here in the states and in Europe. There have been demo units available at most if not all dealers since May.

Perhaps. Perhaps not. Just as a curiosity, this very night I challenged
comp.sys.amiga to defend this widely held view by finding a '386 PC that's
roughly equivalent to the A3000 for any price. I'm certain that the PC I
specified, or something close to it, can be had. I'm not certain it can
be had for less than an A3000. Commodore doesn't make any EISA machines,
and I don't know much about any other PCs, so I'm really in the dark on this
one. But anyone here who wants to take up the challenge, check out the
"Comparable Systems" thread in c.s.a.

Perhaps someone who knows the TT better could attempt a similar experiment
here....

>is surface mounted. I don't know which FPU is in the 15.8MHz Mac IIcx, but
^^^^^^^^^^^^^^^^^^

I am not sure about this - Amiga just had some of there reps come over
to USC to try and interest the school in buying/supporting the Amiga line. The
rep at the demo said that the A3000s came with a coprocessor slot that when a
68040 is dropped in, the '40 takes over and uses the '30 as a slave processor.
I am not sure that this is the same slot as would hold a 68881 (I am not up on
the # of pins, etc.) but with the '40 in the machine, who cares if it has
a 68881 or '82 when it has a '30 doing the job?

Just my $.02 worth.

(BTW, the demo the Amiga people put on was pretty darn good. They showed some
nice genlock/multimedia demos with a laser-disk (of BladeRunner!) controller/
indexing/etc. and the possible uses of such a system. While I was watching it
though, I couldn't help but feel this impossible wish that Atari might try the
same thing: Bring in the TT (or even some high-end Megas) with the apropriate
3rd party wizbangs to make it look saleable. But then reality swept in and I
realized that even if Atari wanted to try their hand at this end of the market,
they would've probably choked on the support end if they were at all honest,
or at least no one would have taken them seriously if they had guaranteed
support for the ST line. <sigh> Oh well .... one can only but dream ...:j)

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <32129@cup.portal.com>
Source record: 239583

Steve Coile asks about eye problems caused by long usage of computer monitors...

The issue of "emissions" from computer monitors has been going on for a long time, and probably won't be settled any time soon.. but the kinds of eyestrain symptoms Steve described aren't likely due to any emissions anyway...

The biggest problem is the relatively close distance between the monitor and your eyes. It strains the muscles in the eye to keep focussed on a plane at the distance of a typical computer monitor for long periods of time.. (it's a lot easier on the eye when it's focussed at "infinity", or far away...)

Add to that the fine detail of a high-resolution screen and the fact that most activity of the eyes is reading text (involving a lot of "start and stop" movement of the eyes, and the parallax adjustments needed to keep both eyes focussed on the same spot), and you get some pretty amazing eyestrain...

One thing that can help is to move the monitor as far away from your eyes as is practical... another solution is to obtain special eyeglasses which re-focus the eyes at a much farther "virtual" distance. Ask an optometrist about these...

BobR

Ever think that the market wasn't there? I believe I speak for quite a large number of people when I say that I never considered purchasing Deskcart because it didn't meet any need that I had at the time. That's a fact of the software business which I've found many companies unable to accept -- people didn't want to purchase their software because it didn't meet their needs.

> Another program I wrote, PRINT-IT! never went
> to market, and, in alpha/beta testing was on pirate BBS's. I'm impressed!

This says more about your ability to pick alpha/beta testers than anything else. I must be part of the 50-60% of ST users who never saw PRINT-IT!. Of course you have to realize that well over 60% of ST users -don't- have a modem. I haven't come across any pirate boards in the 8 years I've had a modem (on my Apple II+/e and then for my Atari ST).

> The bottom line of the whole mish-mosh is should we again buy atari?

In your case, no. I'd suggest you purchase a nice 386 machine and go bother the folks on comp.sys.ibm.pc. Perhaps you could even write programs like your friend and make bundles of money. As for selling your ST -- it's a fact of life that you'll never get as much as you'd like from the sale, regardless of your machine. There are plenty of Mac 512K-e owners who are in the same boat.

Just as an aside here... the Apple II+ systems we had at the Biomedical Library
Learning Resource Center (back in '85, when I was a consultant at the library)
had may similar capabilities. It's nothing new, although the term 'multimedia'
wasn't invented at that particular time. And it doesn't take a machine like
the Amiga (or Mac, or ST) to do it.

1016. Wordup 3.0

Newsgroup: comp.sys.atari.st
Date: 1990-07-27 08:47:53 UTC
From: fsdmb3@acad3.fai.alaska.edu
Message-ID: <1990Jul27.084753.18864@hayes.fai.alaska.edu>
Source record: 239586

Thanks for the Wordup update, though you could have said that it was posted somewere else. I downloaded and unarchived the thing, installed and ran it. But it bommed again, just as the open document window opened. I was hoping that the new revision would fix this, but Wordup doesn't work with Revolver! It would be so nice to be able to swap it in and have it running, but I guess I have to uninstall Revolver, reboot and load it (taking 2-3 minutes to load off my hard drive). Even then the thing is very slow figuring out what font you have selected in the font selector menu. And although hyphenation is great it isn't when the system crashes when you try to hyphenate a 6 or 7 page report. Could it have tripped over the graphic at the right margin?
I felt the new manual was OK, EXCEPT for not telling you how much space you have to clear on your hard drive for it to install (around 2 meg). when it takes 45 minutes to run the instalation program you would think they would give you more of a hint than it comes on 5 SS disks.
I guess I am just upset that WordUp isn't the Robust program that I wished it was. It can do some great things... if it doesn't crash on you.

PS: can anyone remember what that program was that stops drive A from spinning after bootup. It was posted recently I think. What causes this?
Thanks for any input from anyone. 8-)

1018. STs used to produce big-selling magazine - in Vietnam

Newsgroup: comp.sys.atari.st
Date: 1990-07-27 09:56:23 UTC
From: grahamt@syma.sussex.ac.uk
Message-ID: <3159@syma.sussex.ac.uk>
Source record: 239588

I thought people might be interested to know that the ST is the mainstay of the editorial office of one of Vietnam's biggest-selling magazines. Toi Tre (hope I remembered that right) is a youth magazine produced in Ho Chi Minh City. According to the presenters of the TV show I saw it on (a travel/style show called 'Rough Guide to the World') it's a bit tame by Western standards, but it does criticize the government and it names names in corruption scandals. It's name means 'two-thirds': two-thirds of the Vietnamese population is apparently under 30 years of age.

Anyway, the show did some interviews in the editorial office, and this contained lots of STs - some Megas, some in 520/1040 boxes. I couldn't quite make out which program(s) were running. The screens showed a line of function key icons along the bottom, so the program might have been Word Writer or 1st Word Plus. I could be wrong, though.

I wonder what the Atari market in South East Asia is like? Anyone know?

Graham

>Thanx to anyone who can help.
>

As I am the person who wrote this game I think I should reply to this, even though I don't have a solution. The problem you describe is not completely clear to me. Does this always happen or only when there are many moving objects on the screen? In the second case the reason is simply that the program cannot keep up with all the motion and hence the balls move less smoothly. If it always occurs it might indeed be a monitor issue, I don't have a fix for that. The reason why the program is not so fast is that it was written in MODULA-2 and it does a lot (60 types of stones, many balls, monsters, bombs, bonusses, multiple bats, etc.). Any comments are welcome.

|>*IF* I'm wrong, please give a reference to the relevant article.. .
|>(I have seen ads for 5.0MB extensions, where the last 1 MB was
|>used for RAM disk, so perhaps....)
|>
|> Jens

Yes - you *ARE* wrong. First: all those people who used to have 2 banks of 0.5 Mb, and who upgraded to 2.5 Mb have 'switched off' one of the 0.5 banks in order to be able to use this bank for 1 Mbit chips, thus creating a 2.0 Mb bank. Totally expanding a 1 Mb ST with 2 Mb gives you a 2.5 Mb ST, and one unused 0.5 Mb bank. Article: "Aus zweieinhalb mach drei", by K.-D. Litteck, in ST Computer 3/1990 (published by Heim Fachverlag in Germany). (plus: a correction to the schematic in this article in the same magazine, issue 4/1990).

Now using the inactive 0.5 Mb thus resulting in a total of 3.0 Mb is possible too; it really is a hack to get around the 2 bank limit. I will describe

how this is done in the article series in the ...tech newsgroup.

Enjoy!

Jeroen.

>(I am not up on the # of pins, etc.) but with the '40 in the machine, who
>cares if it has a 68881 or '82 when it has a '30 doing the job?

The 68030 and 68882 are vastly different animals, regardless of whether or not
you have a 68040 board in or not. The A3000's Coprocessor Slot is a 200 pin
connector which will support cache, '040, or even a faster '882 if someone
really wants to build such a critter. Add-on CPUs have the option of taking
over from the 68030 or leaving it active, but no one's going to use the '030
as a math processor. Especially the '040, which has on-chip math between
5 and 10x the speed of '882 math.

The reason Commodore and Apple surface mount these things has little to do
with saving the cost of a $1.00 socket. Things get much quieter when they're
surface mounted. And the cost of a part in a surface mount package can be as
little as 1/2 that of the PGA part. Think of it as getting an '882 for the
price of an '881, or something along those lines.

1024. Re: Comments in the STart MIDI-tasking article

Newsgroup: comp.sys.atari.st
Date: 1990-07-27 15:45:30 UTC
From: erkamp@arcsun.arc.ab.ca
Message-ID: <1990Jul27.154530.15503@arcsun.arc.ab.ca>
Source record: 239594

Here are a couple of excerpts from Z*NET Online about MIDITASKING

ATARI TO FINALIZE MIDITASKING AT NAMM

This weekend is the Summer NATIONAL MUSIC MERCHANDISERS SHOW (NAMM), held in Chicago, Illinois. Atari will be there with a major presence once again. The Atari ST with its MIDI ports, and particularly with the STACY portable, has stayed a favorite machine for many musicians. On hand for this show will be Frank Foster (back from touring with FLEETWOOD MAC in support of Atari), Bill Crouch, Bob Brodie, MIDI reps Mike Groh and John Morales, and others. Another MIDI developer meeting is scheduled, and the final input is to be received on the ATARI MIDITASKING system, under development by INTELLIGENT MUSIC of New York. The project is virtually completed and is hoped to be ready for commercial release this summer. Atari representatives have been careful to say that although the MIDITASKING system is indeed a multi-tasking operating system for all Atari ST computers, it is optimized and intended for use with MIDI applications. Although other programs are likely to work properly under the MIDITASKING system, this is to be seen as a fortuitous occurrence rather than by design. MIDITASKING will be sold through Atari Corp for a mere $12.95.

MIDITASKING READY; RELEASE DELAYED

The unexpected low turnout at the recent Summer National Association of Music Merchandisers caused the cancellation of Atari's MIDI developers meeting. It was to have been the last developer meeting prior to taking Atari's MIDI-Tasking module to the marketplace. Atari has not announced a revised schedule for release of the system that will enable multiple MIDI (and perhaps other) applications to run simultaneously on any ST computer.

Source record: 239595

Well as usual this is getting out of hand and no real useful information is being produced. I think the bottom line is that any hardware platform has it niche (some may be bigger than others) and the real key is software. The most important thing is what do YOU want to do with the machine. If that question can't be answered save your money. Once you decided on the type(s) of software you are looking at investigate what's available for the hardware platforms you can afford as well as compatibility with people you wish to share datafiles with. You should also consider the ability for expansion (memory, disk capacity, peripherals).

I beleive that all the machines have decent software at the introductory (hobbyist) level. It's when you get into the serious (professional level) products that one or two of the hardware platforms will stick out as the possible solution. Examples MIGHT be the Atari for MIDI, the Amiga or Apple for Mulitmedia the IBM for CAD (no flames please).

In the future when someone requests info about the Atari hopefully we will suggest some decent software packages for their application and then let them decide if this is the way to go.

> headaches, which feel like motion sickness headaches.

Take this seriously: Computers are bad for you. Headaches, eyestrain
and RSI (Repetitive Stress Injury) are a very real threat to your health.
Don't let your intensity and your enthusiasm for what you're doing
damage your body.

You should *never* spend more than half an hour staring down a monitor.
Make it a habit to look at something distant for a minute out of every
fifteen. Take a break. Move your eyes around.

Get up, center yourself, let go of the problems you've been struggling
with, and do some slow stretching exercises. Since you're at a college,
I would recommend that you discuss this with a doctor at the student health
service and see if you can enroll in a yoga class. (Yoga is a system of
stretching exercises that is ideal for office workers.)

I work at a major metropolitan newspaper where hundreds of reporters
and editors spend eight hours a day glued to computer terminals. We
have at least four editors who are having serious problems with their
wrists. Carpal tunnel syndrome is not something to mess with. Developing
good computer work habits early can pay off in the long run.

Oh yeah. And I suppose Motorola thought about virtual memory management and UNIX when they burned the original 68000 into silicon? Why is it, then, that the 286 can run a real OS with virtual memory and protected address spaces for each process (UNIX System V), and the 68000 can't? Am I missing something here?

1028. MicrO hard drives-- anyone know anything about them?

Newsgroup: comp.sys.atari.st
Date: 1990-07-27 17:42:43 UTC
From: n8742883@unicorn.WWU.EDU
Message-ID: <1261@unicorn.WWU.EDU>
Source record: 239598

As I continue my quest for the *perfect* hard drive, I did some calling around and was surprised to find that a mail order company by the name of MicrOtyme is selling fully functional out-of-the-box (i.e. no assembly required) hard drives for very low prices.

The brand of the hard drive is called "MicrO", which would make me assume that the hard drives are actually built by the mail ordering company itself.

I was wondering if anyone has purchased "MircO" hard drives, and if so, I'd like to know how well they work. I called up a sales clerk, and made her swear on the bible that the Micro drives do not require assembly or any additional parts or labor.

The prices:
$529 for 50 MB (The next cheapest (non-atari) drive I could find was a Supra drive, $499 for 30 megs)

$599 for 65 MB, and
$659 for 85 megs!

With $130 difference between a 50 megs and 85 megs, I plan on purchasing the 85 meg drive next month. I plan to run my Spectre GCR on it, as well.

Anyone out there have any comments / opinions about this drive?

Thankx,

Perry Pederson n8742883@unicorn.wwu.edu

A trick my eye doctor told me about for those who stare at screens a good
part of the day is to look out a window and focus on something very far
away for a few minutes. It supposedly does something to equalize the
balance of the rods and the cones of the eyes.
I've been doing this for a couple of years and I find it DOES relieve
some of the eyestrain you feel at the end of the day.

From: root@trwrb.dsd.trw.com
Message-ID: <412@trwrb.dsd.trw.com>
Source record: 239401

I read in the E. Arthur Brown catalog (612) 762-8847 about a product called ZKEYs interface. "Our new ZKEYs interface allows you to connect an IBM PC/XT/AT compatible keyboard to your Atari St." No soldering. The Atari and IBM keyboards will simultaneously be fully functional.

When I use gulam, I use the emacs command editing. Is there a way of preventing the cursor from bouncing?

Can I use Revolver to save a game to my harddrive and continue the game later? Is Switchback the only product for the ST that will do this?

Thank You,
Gregory Gibson

[]
For people who have anonymous FTP:

On clotho.acm.rpi.edu (128.113.10.204) I've placed file
pub/linedemo.arc, which is a demo of three new PageStream fonts
designed specifically for 9-pin and 24-pin printers! (The fonts--
Lightline Roman, Lightline Italic, Lightline Sans--have very thin
strokes, extra spacing, and other features for extra clarity.)
These are commercial fonts, available for $19.88 (set of three)
from Computer Safari.

If you don't have FTP, I can mail you the font demo, as it's
pretty small.

(Also on the same machine, in pub/pgs18dem.lzh, is the
demo version of Atari ST PageStream 1.8, which is pretty big.)

|>In short, no. Cause: incompatible scan codes.
|
|Actually, I heard about a piece of hardware which has a socket for an
|IBM keyboard in one end and a MIDI OUT in the other, which you can plug
|into your ST's MIDI IN port, and with the aid of software, use the
|keyboard. I don't remember anything else about it though..

there are some other solutions for that to. One you plug i piece of
hardware into the romport of your ST. One just tries to simulate keyhits
of the real ST-Keyboard with a piece of hardware put between the Original
ST Keyboard and your ST Motherboard, so all other keyboardfunctions can be
accessed.. You only have sligthly other Keycodes, which can be remapped
with an XBIOS call (keytable funktion...)

Greetings

1037. ARRGH! I'm bugged! Help!

Newsgroup: comp.sys.atari.st
Date: 1990-07-28 04:25:52 UTC
From: brian@wolves.uucp
Message-ID: <1990Jul28.042552.14503@wolves.uucp>
Source record: 239407

I have an Atari 1040STf (one of the older ones-no rf modulator) and it has had a problem for some time. About once a month or so, when I turned on the computer, it would come up with a sound as if you were holding down a key. (buuzzzzzzzzzzzzz) No mouse movement would be possible and rebooting often did not make it go away. Once, I had to shut it off, unplug it, AND unplug the mouse and joystick (just shutting it off and unplugging did NOT work) to make it go away. Now, I have just added an ICD hard drive adapter and a 20 mb drive. I have had a new version of the bug that buzzes in a pattern; (buuuzzz buuuzzz buuzzzzz buuzzz) about 8 times this evening! Changing resolutions seems to trigger it. Incidentially, it has not happened in the last two hours--but if it comes back I want to be ready to kill it! Does anyone know of this bug? All help will be greatly appreciated!

PS: the battery-backed clock on the ICD board seems to be running slow (loses 5-10 min a day). Is there an adjust for this?

Thanks,
Brian Daniels

Thanks for posting my STe DMA soundchip manipulator/sample player.

It is at at the once named "terminator" archive server, as:
atari/sound/players/eplay20.arc

"... questions... complaints, comments..." about aquiring the program from
that site SHOULD be sent to weiner@terminator.cc.umich.edu, BUT

"Questions, complaints and comments" about eplay20.arc should go to
the AUTHOR at AAron@sun.soe.clarkson.edu

Have fun,
AAron nAAs
AAron@sun.soe.clarkson.edu

hyc@math.lsa.umich.edu (Howard Chu) writes:
>
>The IBM PC wasn't even personable, let alone personal, at its introduction,
>and has only slightly improved since.
>

"Only slightly improved?" I'll admit, the original PC was junk by today's standards, but let's look at this objectively:

```
Then                    Now
-----------------------------------------
Processor 8088 16bit/8bit i386/i486 32bit/32bit
Memory 1MB limit 4GB limit
Speed 4.77MHz 16-33MHz
Diskette 5.25" 360K 5.25" 1.2MB, 3.5" 1.44MB
Graphics None 1024x768 w/16 or 256 colors
Hard Disk None Everything up to multi-gigabyte disks
OS DOS DOS, OS/2, UNIX, others
Expansion 8-bit ISA 32-bit EISA, 32-bit MicroChannel
```

I could go on. EVERYTHING about the original PC has been improved in a big way. How much has the ST improved since 1984? Well, there have been two upgrades of the OS (basically a 68000 version of MS-DOS). A few memory expansion hacks that require the owner to solder little circuit boards into his/her machine. Well, let's see, there were rumors of a blitter upgrade, no? Perhaps one which would work in some machines, but not in others, for lack of a blitter socket on the motherboard?

>
>I personally loathe current Intel chips. I don't care what you
>can do with one, a different architecture can do it better.
>

Hmmm. This is exactly what I'm trying to figure out -- what makes you hate the Intel processor so much? I really see no logic to this unless you've had to spend half your life coding machine language. Once you run an OS like UNIX on your machine, you don't even have to think about the processor. How can something deep inside the machine bother you so much? What's so bad about the i386/i486?

>
>In their standard configuration IBMPCs are useless. In their standard
>configuration IBMPCs boot up into Cassette BASIC and don't even have
>cassette ports (any more, recently, you know what I mean.). And no
>graphics functions at all. In a standard ST or Amiga configuration, you
>have a complete system right out of the box.

>

What? This is horsesh*t. How do you explain the Dell machine on my friend's
desk, which came "right out of the box" with 8MB RAM, SuperVGA graphics,
100+ MB of disk, 2 floppy drives, parallel/serial ports, and UNIX SysVR3 pre-
loaded on the hard disk?

>
>With no need for MultiFUnction
>I/O RAM Expansion cards, monitor adapters with parallel ports, funky
>disk controller cards, bus adapter cards, etc. etc... The ST loses in that
>you can't get anything *but* the standard configuration, but the standard
>is still very useful in its own right.
>

I wouldn't even comment on the ST's standard configuration, but since
I have an interest in graphics, I must say that the ST's graphics
capabilities are totally useless except for games. Let's face it. The
ST is totally incapable of providing reasonable color resolution for
a graphical user interface.

>
>I think there's more to the TT than meets the eye. Why do they specify up
>to 8 megabytes of video memory with the meager selection of graphics modes
>they're offering? 8 megabytes is enough for a 1024x1024 8 bitplane deep
>(256 color) image. I bet you could find at least a half dozen VMEbus cards
>that'll be happy to use that address space for you.
>

Ah, but I thought you said that the whole advantage to these systems was
that you don't have to buy any extra adapters to make them useful.

>
>And while I've seen wonderful still-images on VGA and Super-VGA systems, I've
>yet to see a game worth looking at on one. Even games that support EGA, with
>its 16 color palette, look like they came from a Vic-20. Now while games may
>not seem all that important to you, they are certainly an important part of
>a Personal Computer's functions, and there are a lot of companies out there
>charging lots of $$$ for their so-called graphics games.
>

You're right here. It is unfortunate that most games are still made for the
lowest-end IBM-compatible systems. That means CGA-EGA graphics. You're
right, I won't deny it. ST/Amiga games are still superior. When I had my
ST, Airball, Time Bandits, and Leatherneck were the software I ran most,
and I hated to part with those games.

>
>Business graphics
>don't need more than EGA resolution. CAD needs resolution, but number of
>colors is really no big deal. For the kinds of detailed work you tend to
>see on a CAD system, color gets to be more of a distraction as the level of
>detail increases.

>

Are you trying to justify the ST/TT's pitiful graphics capabilities? :-)
Presentation graphics do require high resolution, and you're wrong about CAD.
CAD involves 3D shaded model rendering, which requires LOTS and LOTS of
colors. Things like desktop publishing and graphic arts also require high
resolution and lots of color.

>
>Well, how's this - there are two kinds of computer users in the world - those
>who care about 'em and those who don't. You're probably one who doesn't, and
>I'm one who does. Not caring about 'em doesn't mean you don't like them, just
>that they're not a major factor in your world view... And obviously people
>like me, who write huge responses to simple questions, well...
>

Well, I'm a software developer; I do care about computers. I want a decent
development environment -- GUI and all. Yes, I believe a GUI is necessary
for software development. Software development requires a multitasking OS,
and to me, a multitasking OS requires a window system to be useful on a
single-user machine, and vice versa. I'm still talking about SOFTWARE.
Unless you're a hardware engineer and you buy your machine only to rip it
apart and modify it, or you're a machine-language programmer, I still don't
understand why the damn microprocessor bothers you so much.

1041. OSCAN60 - beta TOS 1.4?

Newsgroup: comp.sys.atari.st
Date: 1990-07-28 18:42:19 UTC
From: baffoni@aludra.usc.edu
Message-ID: <11092@chaph.usc.edu>
Source record: 239411

I was reading through the documentation on OSCAN60 and it says that if
you do not have TOS 1.2 or higher, the program will not work. It goes on to
say that if you have TOS 1.0, then you need to put beta TOS1.4 (or developer
TOS1.4, but I assume that is DEFINATELY non-PD) in the auto folder. So if it
is legally possible to get this beta TOS1.4, where would one get it? Or will
I just have to chuck the program seeing as how I am a student and FOOD out-
weighs the need for chipped TOS1.4 ?
BTW, do you have to rip open your ST to find out whether you need the
2 or 6 chip TOS1.4 set, or is there a better/non-destructive (for the novice)/
easier way to find this out before one goes and spends $100 on an expensive set
of push-pins? :)

This sounds like something flaky in your keyboard processor. I had this
happen to me once with my Mega, and it took me quite a few tries before I
figured out I had to remove the batteries to get the keyboard to reset. (The
downside to intelligent components... Sometimes they get confused!)

Maybe the clock-setting software for the ICD is causing the breaks in the
buzzing.... What programs are in your AUTO folder?

Anyway... your keyboard processor is probably wearing out or overheating.

1043. Re: TT (Who has one?)

Newsgroup: comp.sys.atari.st
Date: 1990-07-28 23:30:28 UTC
From: gt1448b@prism.gatech.EDU
Message-ID: <11952@hydra.gatech.EDU>
Source record: 239413

Here's my $0.02 worth:

I think Atari would be wise to introduce a bottom line 16 MHz
TT equivalent to a 1040ST (except with FPU socket and SIMM RAM
upgrades) and sell it for $1500 (Maybe this is unreasonable, I'm
no hardware designer). If David Small believes there's a market for
a 16 MHz 68030 ST board, then it seems to me there would be a market
for this TT model. Many users don't need the bells and whistles
promised with the TT and it's ~$4000 US price tag. This machine
would be compatable with current software. It would appeal to
ST owners like myself, who are comfortable with their software and
peripherals, but occasionally have the need for extra power of the
68030 CPU. The biggest complaint from my Mac owning friends is the
lack of a low cost Mac II. I hope Atari doesn't follow Apple's lead.--

In article <32129@cup.portal.com> Bob_BobR_Retelle@cup.portal.com writes:
>The biggest problem is the relatively close distance between the monitor
>and your eyes. It strains the muscles in the eye to keep focussed on
>a plane at the distance of a typical computer monitor for long periods of
>time.. (it's a lot easier on the eye when it's focussed at "infinity", or
>far away...)

Uh, I'm not sure that's correct. If I remember correctly from my
days of dissecting cow eyes, the lens is naturally in a contracted state,
and the muscles pull it "flat" (ie focussed at infinity). Mind you, I'm
not an optometrist, but like I said, that's how I remember it. This seems
to fit with my real-life experiences; I can consciously change the focus of
my eyes (among other things, including moving them somewhat independently
away from each other; I think I'm part lizard), and I noticed that when I
am most relaxed, and when I wake up, my eyes are focussed at closest
range.
I suspect that this fellow's problem might be that his vision is
slightly poorer at close distances. I would encourage him to go see an
optometrist and get a full eye exam. Or it could actually be illumination
levels, that can cause eyestrain too. Or his monitor could be out of focus,
or jittering up and down, or otherwise bad in some way.
Finally, there is one other possibility; it might be that he has a
flickery monitor (especially if he's using a 50Hz monitor); I often get
headaches from fluorescent lights that are old enough to "hum" at 60Hz,
even if I'm not consciously aware that they're flickering (ie it's too fast
to see unless you're looking for it).

From: techno@zelator.UUCP
Message-ID: <684@zelator.UUCP>
Source record: 239415

I don't know about you, but I bought my first ATARI way back in 1981.
Since that time I've heard the same arguments over and over (it's a
games machine, will go out of production soon, inferior to XXX, etc.)
and still Atari Corp. is alive and kicking.
When the sales were going down for the ATARI 8-bit machines in 1985, I
switched to the ST as the cheapest alternative then, but believe it or
not, I can still buy *new* XL's and software here in Germany.
The oldest software I have for the 8-bit is dated 1979, thus, if the ST
were to die today, we would still see it in use in 1995. The ST does all
I want for me, and, being a professinal PC programmer, I don't want *that*
kind of crap on my table at home, *EVER*.

I like my ST, though I'll probably replace my 520 with an ST soon, and will
carry on the ST flag like I do for the 8-bit series. If you don't agree
with me, you're reading the wrong newsgroup. Leave us ST users alone and go
read comp.sys.whatever.you.like or even comp.sys,atari.8-bit (yes, it still
exists and is used :-)).

Hope you agree,

Techno

One thing you should do is every 10-20 minutes look off into the distance ...
and look at something very far away this should help reduce the eye strain.
Also check the lighting conditions. If these problems persist you should see
a doctor. Start magazine just recently had an article on computing furniture
and how to sit and set up your equipment. too.

1048. HI50 Revisited

Newsgroup: comp.sys.atari.st
Date: 1990-07-29 20:40:00 UTC
From: david.megginson@canremote.uucp
Message-ID: <ea70d8f9b04826b365c0@canremote.uucp>
Source record: 239418

I have finally figured out how to get the HI50 hack working for TOS on my computer, thanks to a HI5025.S source module in the code for some program which I no longer recall. But...

IS THERE A HI50 HACK FOR GEM?

How can I get GEM to recognise the 8x8 System font rather than the 8x16 system font as the standard font? Many text-oriented GEM programs (especially those which run on a Moniterm) check font size and use it as their basic measurement. I would love to be able to use the HI50 hack under Dave Beckemeyer's VSH, so I could fit 24 lines in a window. RSVP D.B. or any LineA hackers. Please use one of the addresses below, not the return address on this message.

Thanks,
David Megginson

The Atari TT030 Hardware

The TT030 (Thirty-two/Thirty-two bit) is the first member of a new series of Atari computers designed as enhanced versions of the existing ST and MEGA family. The TT series maintains compatibility with the ST/MEGA architecture, but uses the Motorola 68030 microprocessor and provides enhanced graphics and sound. The TT030 is also designed to run Unix (Unix is a trademark of AT&T).

The TT030 is based on the high performance 32-bit Motorola MC68030 processor running at a 32 Mhz clock frequency. The 68030 includes on-chip data and instruction caches which can be filled from some regions of memory in bursts of double word fetches

The architecture also includes the industry standard VME bus to facilitate expansion. The system supports the latest revision (C.1) of the VME bus specification. The TT030 can accommodate one single-Eurocard (3U) A24/D 16 or A 16/D 16 slave-only VME board,

The TT series is expected to function in an environment with other TTs and even machines from different manufacturers. To facilitate connectivity, each system has an on-board port for a moderate speed LAN. If the LAN is not being used, the port can be

programmed to be a standard RS232C port. Through an optional VME bus-based or SCSI-based Ethernet controller, the TT also has the capability of connecting to heterogeneous Ethernet networks. The TT030 has three additional standard RS-232C serial ports for connection to modems, display terminals, or digitizing tablets.

The hardware features of the TT030 include:

- Motorola MC68030 at 32MHz
- Motorola MC68881 Floating Point Coprocessor (the coprocessor is socketed, so uhat it can be optionally upgraded to a MC68882)
- ST RAM: 2 Mbyte of ST-compatible dual-purpose (video/system RAM, expandable by an add-on daughterboard containing a further 2 or 8 Mbyte of dual-purpose memory. This 64-bit wide memory appears 32 bits wide to the processor and SCSI/SCC DMA engines TT video logic has access to this memory on a time critical basis. The remaining system logic, including the processor, can access this memory in the alternate 250 nS TIME SLICES.
- TT BURST MODE RAM: provision for a daughter-board that will accept either 4 x 1 Mbyte or 4 x 4 Mbyte SIMMS, allowing another 4 Mb or 16 Mb expansion. This RAM can only be accessed by the processor, the SCSI DMA Engine, and the SCC Network DMA Engine. The 68030 can take advantage of burst-mode for filling its internal cache from this RAM.
- 4 socketed 1 Mbit ROMS, providing 512 Kbyte of ROM space.

PAGE 5

- Internal video modes that are a superset of those in the Atari ST/STe series using an analog RGB (VGA-like) colour monitor:

pixels rows colors palette

320 200 16 4096 (STe compatible)

640 200 4 4096 (STe compatible)

640 400 2 4096 (STe superset)

0 320 480 256 4096

640 480 16 4096

using a high resolution ECL monochrome monitor

1280 960 black on white

- parallel I/O port, generally used for Parallel printer output

- internal speaker, which can be disabled under software control

- 2 low-speed asynchronous serial I/O ports (one from each of two 68901 MFPS) at programmable baud rates up to 19.2 baud{

- 2 high-speed asynchronous/SDLC Serial I/O ports (from a Zilog 8530 SCC). One part can be programmed to be a Local Talk compatible LAN interface with a proprietary single channel DMA controller. The other port is intended for use as an asynchronous AS-232 port with programmable split baud rates.

- battery backed-up real time clock (RTC) with 50 bytes of non-volatile RAM

- ST/MEGA compatible intelligent keyboard, with mouse and joystick ports including support for a 3 button mouse

- Atari ACSI DMA channel (for Atari Hard Disk, Laser Printer, CD-ROM, etc)

- Floppy disk controller and interface sharing the ACSI DMA channel

- Musical Instrument Digital Interface (MIDI) STe compatible DMA sound engine with programmable volume and tone control which can play back stereo 8-bit samples at rates up to 50 Khz

- Atari ST compatible cartridge port (128 Kbyte Storage)

- SCSI interface using 23-pin connector implemented with the

NCR 5380 SCSI controller chip and a proprietary DMA

controller

- Industry standard VME bus for expansion

When comparing the TT030 with the competition, four important

features stand out:

- high bus bandwidth, independent of video resolution

- excellent connectivity including four RS232 ports, MIDI,

LAN, ASCI & SCSI.

- high speed burst-mode RAM, 32 Mhz CPU clock speed.

End of Press Release

For the sake of accuracy, just thought i'd correct/supplement Atari's

comparison chart a bit:

(Notes)

1. 68881 in 16 Mhz A3000, 68882 in 25 Mhz. 68882 optional in TT

2. Both machines require optional memory to implement burst mode, this

requires static-column RAM chips on the A3000 and a daughter board

on the TT.

3. The A3000 has 960 line modes as well. More importantly, all video

modes on the A3000 are available as non-interlaced modes.

4. Aside from the proprietary expansion (Zorro III, CPU and video), a

passive IBM bus is available.

5. While the native format is proprietary on both the Mac and the Amiga,

there are utilities to read and write IBM formats.

6. The serial port on the both MAC II and Amiga3000 can be configured

to send and receive at MIDI speeds.

As a 40+ who has experienced this first hand -- get you eyes checked.
The need to concentrate on focusing is a common symptom.

The eye to computer screen screen is quite unlike most everything else
in your life. Its not NEAR, and it not FAR.

1053. Tempus II/Uniterm Question

Newsgroup: comp.sys.atari.st
Date: 1990-07-30 03:37:31 UTC
From: vanleeuw@udcps3.cps.udayton.edu
Message-ID: <1990Jul30.033731.25837@udcps3.cps.udayton.edu>
Source record: 239423

I have a couple of questions:

1) In HiSoft's Tempus 2 editor, in the Tempus Parameters screen,
what does the K (in the upper left corner) do? I know I saw it
once in the manual, but a customer asked me, and for the life of
me, I can't remember or find it again.

2) Is the latest version of UniTerm, Version 2.0e? If so, are there any
intentions to upgrade it?

Please respond via e-mail...and thanks in advance!

Jim

^^^^^^^^^^^
at a near point

Actually, eyes are in a more convex state, or focused on infinity when they
are at rest. The reason that people lose their close range vision with age
is that the lens loses flexibility with age and can't be pulled flat enough.

> I suspect that this fellow's problem might be that his vision is

>>BobR

It's also a good idea (as everyone has been saying) to get into the habit
of periodically looking at a distant object. I do this now without even
thinking about it. I'm in front of a monitor all day long (8 hours, anyway)
and haven't had headaches or any kind of vision trouble. I also have one
of those anti-glare screens at work that cuts down all of those nasty
particles that computer monitors spew at your face.

>something here?

Yes --- you definately are !!!

8086, then 80186, then 80286 --- Three versions to run full Unix.
Personally, I have never seen a 286 run full Unix. I was under the
impression that it took a 386 to do it right. I have seen a 286 run
Xenix though.

68000, then 68010 can run full Unix. Not bad, only the second version of the
architecture. Why not compare apples and oranges. The 68000 was the first
member of the series ... the 8086 was the first member of the Intel series.
Neither could run Unix.

I don't understand why people insist on comparing the 80286, or the 80386
to a 68000.

The 80386 should be compared to the 68030, shouldn't it. Now do you
see why the Intel architecture is so limited. When compared to THE
CORRESPONDING member of the Motorola family, the Intel family falls
far short.

I still believe that if IBM had not developed their PC using the INTEL
processors, that the 80x86 family would not be in existence today. But
that is just my opinion. The Motorola family is strong and has been
independently chosen by a number of different companies to base their
systems on. For the most part, companies that have Intel based systems
have IBM clones.

>something here?

Think about the claims you're making. Note the fact that you are comparing
the 80286, Intel's second generation of the 80x86 line, to the 68000,
Motorola's first generation of the 680x0 line. If you compare it to the
68010, you'll find full vm support, and a lot of nice features, such as
linear address space, normal data format, a stack that grows in the right
direction, &c. If you're going to compare Blueberries to Oranges, you're
not going to be accurate. And, anyway, the 68000 can, but the ST's MMU,
since you seem to be basing your experience on the ST, can't. With a
proper MMU, the 68000 had "protected(supervisor)" mode long before the
80x86 architecture.

I recently upgraded to TOS 1.4 and would like to know what
programs I should have in my auto folder (I know this has
been discussed a zillion times but...). The types of programs
I am interested in fall into one of two categories.
A. Programs I need (poolfix etc.)
B. Programs that improve the environment (mouse
accelerators etc.)
I already have UTS III, TURBO ST and others. I am looking
for PD or shareware stuff the fix the 1.4 inadequacies.

Thanks

Offhand, the (soon, if not already, discontinued) Sun 386i comes to mind. SunOS ran on it, and DOS in a window (or as many windows as you wanted), if I remember rightly.

Early on in the Clone Wars, there were a lot of machines which ran MS-DOS, but which weren't exact IBM clones (most of them were in fact better in one way or another-- more memory, lower price, better graphics...). I doubt that's what you're looking for, though.

1065. tetris sequels

Newsgroup: comp.sys.atari.st
Date: 1990-07-31 01:47:50 UTC
From: cdixon@eagle.wesleyan.edu
Message-ID: <1990Jul30.204750.32015@eagle.wesleyan.edu>
Source record: 239435
Cross-posted to: rec.games.misc,comp.sys.atari.st

Does anyone know of any games (PD or commericial) that are like tetris but expand upon the idea? I'm not talking Weltris, I mean a game similar to the arcade tetris with added features (like added blocks and lines, two-player simultaneous, etc). Being a huge fan of tetris, I've been looking for a better version of it for a while without success.

Also, does anyone know if there was such a game, would it be a copyright infringement? Even if the game was based on the same idea but greatly expanded and changed? Since 9 out of 10 games released are ripoffs of older games (like defender, space invaders) it would hardly be an exception. The only case of copyright infringement I've heard of was between Atari (who owned the home rights to Pac-man) and some other company (I think Oddessy 2 for their KC Munchken), but their are probably a number of others.

Any thoughts on this would be greatly appreciated (its been burning a hole in my mind for days now).

1066. Fontz! - importing a mac font for a 9 pin printer

Newsgroup: comp.sys.atari.st
Date: 1990-07-31 03:00:04 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <4089@rodan.acs.syr.edu>
Source record: 239436

When using Fontz!, I can import a Mac font for use on my
hi-rez monitor. But I cannot get that same font to print out
in any usable form without a great deal of editing after I
scale it. Is there something I'm missing here? or do you just
have to do a lot of editing for this kind of operation? You
see, I ported a 12 Mac font, which came out to be a 14 point
GDOS font for the monochrome monitor...but when I tried to
scale it for the printer, it prints out very tiny!
Any help will be GREATLY appreciated.

It is recommended that from time to time during a long stay in front of a
monitor, or anything else that you are staring at "up-close," that you
excercise_em !!!!

```
excercise_em()
{
while (you think it is necessary)
{
eyes_focus(something relatively far away);
eyes_focus(something quite close);
}
}
```

Ya, it's not related to the Atari St specifically, but at least note that I
am NOT adding/responding to the REALLY ANNOYING CRAP that has been
clogging this group recently !!

>expanded and changed? Since 9 out of 10 games released are ripoffs of older
>games (like defender, space invaders) it would hardly be an exception.

I could be wrong about this, but I believe that game _concepts_ can not
be copyrighted, trademarked, patented, or anything else. I think only
the game characters can be legally protected. E.g., the Pac-Man
character's appearance, name, etc. can be (and is) legally protected,
but the concept of "you're in this maze and you have to eat dots"
isn't. I believe Odyssey lost in the Atari (Pac-Man) vs. Odyssey
(KC Munchkin) case because the "munchkin" looked a lot like Pac-Man and
the ghosts in KC looked a lot like the ghosts in Pac-Man.

When it comes down to it, though, these things are determined by whether
or not the company that owns the rights to the game really wants to
go and sue the company or individual responsible for the "rip-off". In
the case of Atari vs. Odyssey, it was definitely worth it, since the
Odyssey II was competing with the Atari 2600 (aka VCS).

One interesting new twists to this whole issue is the "look-and-feel"
verdict in the recent Lotus case. I suppose if you made a game which
"looked and felt" like someone else's game you'd lose in court.

Considering how many tetris ripoffs (or clones, for that matter) have
shown up in the PD archives, I don't think Spectrum Holobyte would
get too excited about new PD tetris-type games. Commercial software,
however, is another story. If Spectrum felt that the sales of the
competing ripoff were hurting them, I bet they'd sue in order to get it
off the market. (A guess only; I have no affiliation with or special
knowledge of Spectrum Holobyte.)

MX2 is a multitasking kernel written by Fred G. Brooks. It's PD, comes complete with source code in Modula-2. You can use it with Gulam or just about any other command shell. It also comes with a desk accessory that it uses to allow multitasking GEM programs.

It works pretty well, but I didn't like it because it didn't duplicate the current environment in spawned processes, and I didn't have a Modula-2 system to fix it with. (Nor do I know any Modula-2, so trying to fix it would have been like searching for a needle in a haystack. I certainly didn't enjoy trying to read the sources...)

1071. Amiga 3000/Atari TT Comparison (was: Atari TT Specs)

Newsgroup: comp.sys.atari.st
Date: 1990-07-31 04:55:00 UTC
From: BARRETT@OWL.ECIL.IASTATE.EDU
Message-ID: <58888A6081FF204FA2@ISUVAX.BITNET>
Source record: 239441

I would like to make a few corrections and additions to the comparison
table which was in a previous message about the Atari TT. All changes
are with respect to the Amiga 3000.

Comparison of standard features

Amiga 3000 Mac IIcx Atari TT030

CPU 68030 68030 68030
FPU Yes Yes Yes
Clock speed 25 Mhz 16Mhz 32 Mhz
RAM (In MB) 2 to 256 1 to 32 2 to 26
MAX RAM on 17 ? 8
Motherboard
Burst Mode Yes No Yes
ROM 512K 256K 512K
Graphics
Max resolution 1008 x 1024 Optional 1280 x 960
Non-Interlaced Non-Interlaced
Max colours 4096 Colours 256 Colours
from 4096 from 4096
Max video RAM 2 Mb 8 Mb
Highest Colour 320x512x4096 320x480x256
Resolution Non-Interlaced Non-Interlaced
Sound Stereo Stereo Stereo
Expansion ZorroIII NuBus VME
Bus Width 32 Bit 32 Bit 16 Bit
# of Slots 4 6 1
68040-Ready? Yes No No
Hard disk DMA Non-DMA DMA
Synchronous SCSI? Yes No No
Floppy disk Proprietary Proprietary Non-Proprietary
PC/XT Comp. PC/AT Comp. PC/AT Compatible
Network No Yes Yes, DMA
Serial 1 x RS232 2 x RS232 4 x RS232
Parallel Yes No Yes
MIDI No No Yes
ROM Cartridge No No Yes

1072. VDI GDOS-driver ?

Newsgroup: comp.sys.atari.st
Date: 1990-07-31 05:38:54 UTC
From: dkreiner@faui09.informatik.uni-erlangen.de
Message-ID: <dkreiner.649402734@faui09>
Source record: 239442

Hi netters,

a friend of mine build his own graphics card for the ST and now
we have the problem to let GEM and especially the Desktop use
it as the standard device.

I know I'll have to cope with GDOS somehow, but wasn't able to
find exact information on how GDOS passes parameters, what
GDOS supposes you to do yourself and so on.

So any pointers to literature would be appreciated.

Thanks

Dirk

1073. Portfolio memory expansion

Newsgroup: comp.sys.atari.st
Date: 1990-07-31 07:58:13 UTC
From: mfolivo@sactoh0.UUCP
Message-ID: <3640@sactoh0.UUCP>
Source record: 239443

(Gee, back after about two months and I still see people bitch
about Atari... oh well)

Okay, I just bought an Atari HPC004, otherwise known as the
Portfolio, and I have this question...

Can anyone with reliable (please, no speculations or rambling
tirades about vaporware or Atari's alleged business practices, eh?)
information tell me if the memory expansion is forthcoming? I would
like to use the HPC-004 as a communications terminal, and would
like to explore more possibilities of it's capabilities.

By the way, (and this surprised me!) The Good Guys is running a
FULL PAGE Atari Portfolio ad, and we are including the Parallel
Interface and a 32k Memory Card *FOR FREE*. About $130 in
accessories thrown in. Needless to say, I finally bought one.

Although I work at The Good Guys, Portfolios are sold in another
department, and I would not benefit by "advertising" it here, but I
post this blurb as a service.

My guess is that Atari is throwing in some co-op ad money, and
offering the Portfolio/32k Card/Interface at a nice price to our
buyers to help Portfolio sales. Of course, as a long time Atari
enthusiast, I hope it works. I certainly am reserved about some,
shall I be kind, "detractors" that work for the company and
disparage the Portfolio...

>hyc@math.lsa.umich.edu (Howard Chu) writes:

>>The IBM PC wasn't even personable, let alone personal, at its introduction,
>>and has only slightly improved since.

>>I personally loathe current Intel chips. I don't care what you
>>can do with one, a different architecture can do it better.

>Hmmm. This is exactly what I'm trying to figure out -- what makes
>you hate the Intel processor so much?

This is something that in other circles would be politely called "chauvinism"
or more impolitely, "bigotry"..

It doesn't really matter in the bigger sense of the world, since the company
which uses Intel chips to make computers (IBM) seems to have a good idea of
where they're going, and how to get there, while the company which uses
Motorola chips (Atari,Corp) is run by amateurs, interested only in the
shortest term profit possible.

In the long run, it's not going to matter which CPU chip is more capable,
as it is which company knows what it's doing...

>knowledge of Spectrum Holobyte.)

>Dave Baggett
>dmb%wam.umd.edu@uunet.uu.net

Uhhh...hate to tell you this but Spectrum-Holobyte already has started that.

In comp.sys.amiga, it's been really getting a going-over....
S-H even forced (because he doesnt have the resources to fight a lawsuit)
Fred Fish, keeper of the Fish Disks, to remove all the PD Tetris clones
from the archives.

However, since Nintendo apparently holds a better share of the rights
(there are SEVERAL companies each trying to hold the copyright on Tetris
and prevent the others from using it) than S-H, we in comp.sys.amiga wonder
how S-H even has a leg to stand on! Suffice to say S-H generally gets
a negative opinion......it doesn't seem to have shown any good qualities to
us....
I still know of a few BBSes where I can get a PD tetris clone far better
than S-H's!

An idea came up recently: if pirating hurts companies, and can cause them
to go bankrupt, show your support for the good companies by encouraging
pirating of the BAD companies' software!

If they don't make money, they won't be able to make bad software!

Nice idea ey ?

Any scofflaws out there who wanna start this ? :-)

(This does mean you have to stop pirating GOOD software!)

(Yeah so I APPEAR to be encouraging illegal stuff! I'll claim insanity
before they haul me off to jail... :-)

Is there a way to create accessories with the GNU gcc on the ST? I tried
the naive way --- just compile it and name it BLA.ACC --- but that did no good.
I tried the acskel.c supplied with the gemlib for the GNU gcc.

So how do I do it?

1078. External floppy problems and a Lurking Horror....

Newsgroup: comp.sys.atari.st
Date: 1990-07-31 12:56:32 UTC
From: johnsonc@topaz.ucq.edu.au
Message-ID: <6252@topaz.ucq.edu.au>
Source record: 239448

Does anyone out there have trouble when booting with an external floppy drive? I'm passing this on from my father who's had the trouble.

When he boots with the external drive on and with a disk in it, numerous things sometimes happen (if it is un-write protected):

a) Files can be corrupt.
b) Disks can lose EVERY file.
c) You can try reading the directory but it gives an error (data on disk may be damaged) and when you say CANCEL you get it. But this only works once in a blue moon. Other times you get a blank window for the directory.

We thought there might have been a virus on but our virus killers didn't find any. Does anyone out there know about any such thing happening????

* * * * * * *

But my little question is, "Does anyone have LURKING HORROR for the ST?"

I played some of it on a friend's ST but he's moved off and sold it without telling me (some friend). Can anyone help with it?

Regards.

I too had this happen when I first got my (used) ST. As near as I
could figure, some important chips had come loose. The computer just
forgot it had a drive in the middle of disk read. THis did bafd
things to the disk. I took the case off and reseated all the chips I
could. The problem cleared up. It has happened twice since then.
However the by using the "kill" option in the PD Vkiller program
(Version ?) I was able to get the data back. (Don't ask me why that
worked. I know it shouldn't.)

My response to all announcements of new hardware (and most announcements of new software), and not only from Atari by any means, is mild interest. Until my local dealers have them (and I may be better off than some, because there are local dealers for most of the major lines, including Atari), they aren't real, just possibilities. A 32 MHz TT with a price in a usable configuration under $2500 would be nice, but unless it's for sale now, I have no particular feelings about it.

1082. GFA Raytrace SPL files

Newsgroup: comp.sys.atari.st
Date: 1990-07-31 15:17:22 UTC
From: tgkreimer@miavx0.ham.muohio.edu
Message-ID: <188.26b568c2@miavx0.ham.muohio.edu>
Source record: 239452

The setup:
I have just started using GFA Raytrace and am off to a slow start.
While I like the package, I find it disappointing that I can't share
the results with others because of their 512 color format.

The take:
Anyone know how I can convert the 512 color SPL files to Spectrum
format or directly to GIF? Either one would be great, as then I can
distribute them easily.

Thanks:

The newer Intel CPUs aren't too bad, the problem is that over 99% of the software available doesn't use the 80x86 to its fullest. Virtually all software still has the limitations of the 8086 so that it will run on those dinosaurs. This is why you hear people saying that Intel chips suck, because all of that segmented register garbage and the 640K "barrier" are still there. Yeah, I know, "but you can run Unix or, or or (whine whine)..." you're talking about less than 1% of the IBMmers out there, everyone still runs DOS. Maybe Windows will change that, we'll see. I won't even talk about Extended memory Expanded memory, CGA, EGA, HGC, MDA, VGA, Super VGA, MCGA, etc. Software houses have to address a lot of these different "standards" if they want their software to sell. It's a pain, it makes the software more expensive, etc. Are you starting to get the picture yet?

>It doesn't really matter in the bigger sense of the world, since the company
>which uses Intel chips to make computers (IBM)

Gee, I thought other companies used these too?! But there is only one prevailing architecture for them all, IBM's. IBM could have released dog shit with an attached keyboard and monitor back in (1981 was it??) and all of the same people would now be screaming about how great the "standard" is. There are people that buy things from them just because they are big, no matter what the product is.

>seems to have a good idea of
>where they're going, and how to get there,

Yeah, SURE they do.

>while the company which uses
>Motorola chips (Atari,Corp) is run by amateurs, interested only in the

Commodore, Atari, and Apple all use 680x0 chips. Just what is your point here, though? Are you saying that IBM isn't interested in a short term profit? If there's anyone showing "bigotry" here.......

>In the long run, it's not going to matter which CPU chip is more capable,
>as it is which company knows what it's doing...

Exactly. It's attitudes like that that keep "Big Blue" in the "Big Black".

>Xenix though.
>

First of all, the 80186 was not the "successor" to the 8086 -- it was
just a different version of it, more suited towards microcontroller
applications. The 80286 is the second chip in the 86 series. There are
at least 3 vendors of UNIX System V for 286 machines.

>
>68000, then 68010 can run full Unix. Not bad, only the second version of the
>architecture.
>

The 68010 runs UNIX? Are you referring to the long-gone Sun-2 line? Didn't
Sun use proprietary memory management hardware for all their worksation
lines all the way through Sun-3/68020? The 68010 is the second version of
the architecture? What about the 68008?

WHO THE HELL CARES WHAT VERSION of the architecture can run UNIX? Does it
make sense FOR YOU to choose a 68000-based machine over a cheaper and much
more powerful 386-based machine just because you think it took MOTOROLA fewer
tries to make their chips capable of running UNIX?

>
>The 80386 should be compared to the 68030, shouldn't it. Now do you
>see why the Intel architecture is so limited. When compared to THE
>CORRESPONDING member of the Motorola family, the Intel family falls
>far short.
>

You still haven't told me WHERE it falls "far short" -- at what stage. There are too many ways to compare the processors. One could ask, "At what stage in each chip line could the chip run UNIX without any additional memory management hardware?" The answer there would be "80286 and 68030". The chip lines are too different to be compared feature for feature. What difference does it make anyway, since by the time the 386 and the 68030 became available, the two lines converged in terms of capabilities.

Your argument is like saying that the Lexus is superior to the BMW because the first version of the Lexus is comparable to the umpteenth version of the BMW. I suppose that makes the BMW line "so limited"?

Excuse me, but even the 68020 does not have full VM support. That's why
it requires a 68551 MMU to run UNIX. Sun's 68020 machines, I believe,
used a proprietary MMU. "Normal data format"? "Stack that grows in the
RIGHT direction"? Who determines these things? Programmers don't have
to worry about these things even at the machine language level!

>
>If you're going to compare Blueberries to Oranges, you're

>

I wasn't talking about supervisor mode. I was talking about hardware
support for multitasking with an isolated memory space for each process.
And besides, certainly, we can always throw more hardware at the problem.
We could use a real MMU on the ST, just like we could put a 386 processor
board into an 8086 machine. But I still haven't come closer to under-
standing why people on this newsgroup hate the Intel processor, when the
Intel/Motorola lines are so similar in terms of performance.

1087. Some errors

Newsgroup: comp.sys.atari.st
Date: 1990-07-31 16:44:09 UTC
From: barrett@jhunix.HCF.JHU.EDU
Message-ID: <5969@jhunix.HCF.JHU.EDU>
Source record: 239457

There was an article posted recently about the Atari TT, and it
contained some errors. I wanted to point them out. I'm sorry that I lost
the original poster's name; I believe this info was typed in from an official
Atari flyer in New Zealand.

> Comparison of standard features
> Amiga 3000 Mac IIcx Atari TT030
>Clock speed 16 Mhz - 32 Mhz

Misleading -- the Amiga 3000 comes in 16 and 25 MHz models.

>RAM 2 to 17 1 to 32 2 to 26

Wrong -- the Amiga goes from 2-18 MB internally, but up to 1.7
GIGABYTES of RAM is addressable as standard.

> Max resolution 1280 x 480 Optional 1280 x 960
> Interlaced Non-interlaced

This is a very misleading comparison. The 1280x960 Atari mode is
listed as "Moniterm monochrome." If so, you need a Moniterm
monitor... right?

The Amiga also has such standard graphics modes. They go up to
1008x1024 resolution with a compatible monitor.

> Max colours 32 Colours 256 Colours
> from 4096 from 4096

Wrong -- Max colours is 4096 from a palette of 4096 on an Amiga.

> Max video RAM 1 Mb 8 Mb

Wrong -- Max video RAM (called CHIP RAM on Amiga) is 2 MB on an
Amiga.

>Expansion Proprietary NuBus VME

Only partially correct. Amiga has both proprietary and IBM AT slots.
I might mention that these "proprietary" slots are 32-bit DMA,
running at the full speed of the bus/processor. The name of the
Amiga expansion type is "Zorro III".

Another omission is that the Amiga has a processor slot for
plugging in a 68040. The machine is ready for it; just plug it in.

>in an IBM or ibm clone? (Of course, Compaq was using an 8088 in the
>early days, not an 8086).

My previous employers - Systime Computers - had a range of machines: the 300, the 500 and the 2000 which where all based on the 8086. They were all multi-user machines running Systime's own operating system MPS. I still have a 300 in my garage - 1Mb of memory, 10Mb of disk and four serial ports.

About a couple of hundred of this range out there still in service.

Without exception, these systems were completely non-PC architecture and bore no more than the relationship created from the fact that the CPU was an 8086.

Here is an article from ZNET #525:

Author: James R. Glenn File names: VSQUARED.LZH; VALGUS.ARC
File type: Game Program names: VALGUS SQUARED; VALGUS

From the docs to Valgus Squared:

"...In VSQ, the seven familiar Valgus pieces are back, but they are tired of falling straight down the screen! Instead, they will come at you from all four sides of the 27x27 playing area. In the middle of this area is a solid 3x3 block. When a piece hits this block or any other pieces that have fallen before it, it will become locked into that place, and a new piece will drop from a randomly chosen side. The object of the game, instead of completing lines across the screen, is to complete squares around the center block. The first square out is 5x5, the next is 7x7, and so on. To help you keep track of which square each position on the screen belongs to, once a piece has fallen, each of its four constituent blocks will change colors. Thus, at the beginning of each round, blocks in the 5x5 square will be blue, those in the 7x7 will be green, then yellow, orange, red, purple, and back to blue again to restart the cycle. When you complete a square, all the squares on top of it will move in. Once you complete a certain number of squares (5 on the first level, 7 on the second, and so on) the round will end and you will be awarded a bonus. Your bonus is determined by the number of empty squares around the perimiter and how far you are into the game. The playfield is then cleared and a new round begins..."

As you can see, Valgus Squared is Tetris with a good twist, a twist that should keep PD/shareware game players happy until the next variant comes along. The program ran well...until I finished a round and let the game run for awhile on _my_ machine. Then I got a "FATAL ERROR" and was forced to go back to the desktop. Shucks. But as you can also see from the clear docs above, VSQ has a lot of potential.

On to Valgus. Yo, ho-ho! After playing it for about half an hour, I could tell this game has a couple of nice touches. Valgus is much more faithful to its parent than its brother above. The one major difference I noticed between Valgus and Tetris was a vertical wall that had been added to each side of the 'well' on one of the levels.

I got an error on my machine when I ran the game from a floppy, but I got no such error when I ran it from the same floppy with the hard drive online.

1090. Turtle tip

Newsgroup: comp.sys.atari.st
Date: 1990-07-31 19:09:15 UTC
From: rcd@cbnewsj.att.com
Message-ID: <1990Jul31.190915.7676@cbnewsj.att.com>
Source record: 239460

Those of you using Turtle 3.0, George Woodside's excellent hard drive backup utility, may already know that it is incompatible with CACHEnnn.PRG. Many people have CACHEnnn.PRG in their AUTO folders to take advantage of TOS 1.4's disk caching capabilities.

I recently bought an ICD hard drive, and was surprised to find that Turtle gave me a fatal error message, even though I had turned off CACHEnnn.PRG. After much investigation, I found that the ICD hard disk driver, ICDBOOT.SYS, was the source of this new incompatibility. It turns out that my ICDBOOT.SYS was pre-configured to allocate blocks for read/write caching. I fired up HDUTIL.PRG, and re-configured ICDBOOT.SYS to disable all caching. Doing this made Turtle happy. I could then back up my hard drive. After that, I re-enabled the ICD caching, and CACHEnnn.PRG.

I hope this helps other Turtle users who own ICD drives.

There are at least 15 different PD/Shareware versions of Tetris for the IBM. Many of them are unremarkable. They are mostly two-dimensional tetris, with some 'extended' block sets - pentominoes (based on 5 blocks), allowing diagonal connections in the block set, and the like. They are pretty boring.

I do recommend the commercial game BlockOut, however. It is a true 3d version of tetris (unlike welltris, which is just bizarre). There are three block sets: a flat set, a basic set (4 unit blocks), and the 'extended' set - 5 unit blocks. One plays down a well, the pieces falling to the bottom.

Game play is good. One eventually builds up the skill that, when given a piece allows one to move it into a new orientation effortlessly (even with 6 rotate keys).

The only problem is the piece sets don't seem to work too well. The flat set is very boring, the simple set only has about 6 pieces and becomes a game of speed in narrow wells (or trivial in wide wells), and the extended set has some pieces that just can NOT be places simply.

Its still a great game, good for 3d visualization..

1093. Perl for Atari ST?

Hello.

Today, at netmbx, I have seen a local posting stating a PC-version is
available for download. So I ask whether Perl is already ported to the ST.

In article <0817898@mist.UUCP> woju@mist.UUCP (Wolfgang Jung) writes:
I encountered a problem with the 'stevie' editor:
when loading a big file eg:stevie.doc the stevie won't react on
curser key hits properly.
Does someone has encountered this bug/problem too, or knows how to
remove that bug..

I didn't have this problem with a file of about 220K (6000 lines).

But I hit a severe bug!
I wanted to indent the whole text by using ">G" and stevie (v3.91) bombed
at me! I checked the command on a small file and it worked!
Conclusion: stevie does indenting via the yank-buffer, but is failing
to see the overflow! In other situations (e.g. deleting a huge block), I
get a question yank-buffer exceeded, confirm? and that's it. When indenting
I didn't get this message but two bombs instead.

Please correct it asap!

Another implementation of vi did a nice trick: It checked a flag whether
the file has been changed since loading. As it wasn't, it re-loaded the
textfile with indenting... It had trouble when saving the result onto
another filename. It told me the disk was full (It wasn't - I had about
1 meg free, and the program stopped after writing 90K). SIGH.

From: hyc@math.lsa.umich.edu
Message-ID: <1990Jul31.232432.14554@math.lsa.umich.edu>
Source record: 239465

I just received my MagicSync multiscan monitor finally. I made a cable to use in color mode. I'd like to get hold of an OmniSwitch, (from Talon Technology?) - does anyone know of a good source & price?

I'm also stuck in the game Future Wars. I can't get out of the monastery. Any hints/spoilers would be most welcome.

PS - Using Overscan, I get 832 (831) horizontal pixels and 280 vertical in medium resolution. (416 H in lo-rez). This monitor has .28mm dot pitch, rated for 1024x768, 45-90hz vertical refresh, 15.7-36khz horizontal. Has a 9 pin TTL RGB socket as well as a 25 pin analog RGB socket. I rigged up my own cable for the color display, and need a good way to switch into monochrome.

PPS - has anyone come up with a hack to make the ST use interlaced video? It'd be nice to get 560 vertical instead of 280...
(Tho it's pretty nice right now, 104x35 text in med-rez. Only quirk is that GEM desktop now thinks you're using a "big" screen [which you are, I guess!] and displays windows in 2 columns.)

All responses to any/all questions greatly appreciated.

Certainly, due to the 200pins of the 68030, this is THEORETICALLY possible,
but due to the hardware constraints (limited card slots, bus width, power?:)
just how much can you ACTUALLY address in the REAL world (no flames, this is
an honest question)?

[stuff deleted]
>> Max colours 32 Colours 256 Colours

>
From what I understand, the 4k out of 4k colors obtained is due to
software hacks (HAM methods, scanline interrupts, etc.), but I think that the
question of comparing them is directed at standard system constraints rather
than at what can be done by tweeking the normal draw cycles.
So what would the max colours be WITHOUT scanline tweeking?

1099. STe

Newsgroup: comp.sys.atari.st
Date: 1990-08-01 05:01:13 UTC
From: ekrimen@wet.UUCP
Message-ID: <1405@wet.UUCP>
Source record: 239469

Well, I bought my STe yesterday. :^))

For those interested, these are brief thoughts (I'm a very simple thinker :^) on my first hours with my STe. Actually, I have a lot of questions. So, on with the show!

The whole purchase was kinda anti-climatic 'cause I was concerned that it might not work with my ICD hard drive, fitted with ICDBOOT version 4.8.2. But,...

I'm glad it works! So far, at least. To those who know a little more about problems with the STe and hard drives, how long will it take for the bad signs to show, if they do? Or should they show right away? Before I sold my old 1040, I backed everything up, just to be on the safe side when I got the STe. When I attached the hard drive to the STe, I copied a full floppy of stuff to my hard drive to check for the write-error; y' know, the one where the STe may drop two bytes of everything. Everything was okay. Then I formatted the hard drive and copied everything again, and it was okay. I've even tried formatting a disk in drive A: and it worked okay (BTW, what was supposed to happen if it didn't?). I've heard stories about not being able to format a disk in drive A: with the hard drive connected.

My second observation is that the screen isn't as bright as when it was attached to my other 1040. No, it's not because the screen brightness control on my monitor is changed, but the default white is a lot less bright. When the computer is first switched on, the screen is white like the other one for less than a second, but then lowers in intensity and remains that way. Are others like this, or is it just mine?

Next, I get an awkward display when I hold down the reset button on the back. The other 1040 just went white when I would hold the button down. The STe produces a scrolling set of lines that looks like radio interference. I know, you just have to press and release the button to reset it, but I thought this was sort of strange. Again, are others like this, or just mine? Yeah, yeah, I know that all Atari computers of the same model aren't produced identically :^), but I'm still curious if you think mine's acting weirdly.

This scared me: when I tried to install NeoDesk for the first time from the "Install Application" selection from the desktop, I didn't get the |Install| button. I got |Remove| and |Cancel|, but no |Install|. I did something later, and I got it to work. Maybe I had an 'old' DESKTOP.INF file in my root directory, and that had something to do with it.

On a related note, during the first couple of hours of getting my STe home, I double-clicked on a program named CONV.TTP, and received a Show, Print, Cancel dialog box. Maybe I had an old DESKTOP.INF file and this was bothering it. I remember Darek Mihocka mentioning this in his reviews of the STe. I haven't seen the problem since that first occurrence.

Next, aren't TOSs later than 1.4 (or is it 1.2?), supposed to turn off the floppy light automatically after the hard drive boots? Mine doesn't.

Yeah, I know this is a lot of questions, but I thought it might add some much-needed discussion in the ST arena. "Who made me moderator?", you say? It's a good thing I don't write reviews for magazines. :^) BTW, this is being posted to comp.sys.atari.st and Fidonet's Atari ST echo. Users on both nets have the pleasure of enjoying this twice! OH BOY! ;^) And, for those who have had the STe's for quite a while, I'm sorry you have to wade through this. I've been trying to keep up with the info, but still have some more questions. I appreciate your help.

On a positive note, this STe is great. It's quick! File writes, screen draws, everything. It's one nice machine. Wouldn't trade it for anything! If you can upgrade, do it.

(The following is just my opinion. Any similarity to the truth is coincidental. I hope flames get lost in the mail.)

Macs are not worth the money.
MS-DOS should be featured on the HA! Channel.
And, Amigas, well, multitasking IS nice -- but that's about it. My multitasking will be limited to Mystic and STalker until GEM and TOS multitasking comes out for the ST.

1100. Read/Write Spectre Format?

Newsgroup: comp.sys.atari.st

Replying to John Bruno's points...

Commodore has been doing OK using 680XX chips...

Apple has released some pretty impressive, if pricey, 680XX machines...

Atari has just about vaporized us all with their 680XX pipedreams...

The point is that it really doesn't MATTER what CPU a product runs, if
it's a success commercially...

IBM and all of its clones have sold MANY times more units than ALLLLLLLL
the 680XX machines combined...

That doesn't mean the 80X86 chip is any better than a 680XX chip.. it just
means that the company that sells the computers seems to have a better
handle on how to sell computers...

"Big Blue" is in the "Big Black" while Atari Corp is in the "Big Toilet",.
not because of any choice of microprocessor CPU...

AAron aAAs writes:
>Ya, it's not related to the Atari St specifically, but at least note that I
>am NOT adding/responding to the REALLY ANNOYING CRAP that has been
>clogging this group recently !!

Well, AAron... as long as Atari, Corp. keeps giving us ST owners nothing but REALLY ANNOYING CRAP, I'd imagine that we're going to be seeing a lot more of it..

If you read any of the Commodore and Amiga newsgroups, or IBM newsgroups, or Apple Macintosh newsgroups, you really won't see much REALLY ANNOYING CRAP... for some reason, it's only as a result of the things Atari Corp has been doing (or not doing) that you see a lot of REALLY ANNOYING CRAP in the Atari newsgroups...

Wouldn't it be great if Atari Corp would produce lots of Atari ST computers, and flood the market with really great computers, and promote those really great computers, and induce lots of dealers to sell those really great computers, and advertise all those really great computers.. instead of giving us a lot of REALLY ANNOYING CRAP...?

Oh well.. I guess if we just ignore all that REALLY ANNOYING Atari CRAP, it'll all go away...?

Chris Dixon asks about Tetris sequels..

I've seen one game that takes the "Tetris" play mechanic to another order of magnitude.. it's called "Valgus ^2", or "Valgus Squared"...

Valgus was an Atari ST clone of Tetris, and Valgus Squared is a complete takeoff on the idea..

The blocks come in from all four directions, and the object is no longer to simply make lines from the falling shapes, but to make complete squares in the middle...

I guess I'm going to have to figure out how to send UUEncoded files from Portal, eh...?
:)

> Hmmm. This is exactly what I'm trying to figure out -- what makes
> you hate the Intel processor so much?

The question wasn't asked of me personally, and I don't think I actually HATE Intel processors, but I can think of two things that might prejudice some people against them.

1. The 'low byte - high byte' ordering of numbers, which is the opposite of Motorola chips (other chips, like those from DEC & IBM, divide along similar lines). Very much a matter of taste.

2. The 'segment+offset' way of addressing memory locations. This is probably the most crucial difference for people who care about these things. I remember that Neil Harris, when he worked for Atari, used to sign messages with the declaration: "Segments are for worms."

There again, I don't do any low-level programming, so I'm not the most knowledgeable person to comment. There may be all sorts of other amazingly important differences!

>
I'm writing this followup on a Sequent Symmetry that's using, I think, six 80386's. It distributes its *nix processes across these processors and you can even compile programs to incorporate some degree of parallelism.

This is just for information. I'm not saying the same thing couldn't be done, or couldn't be done better, on other processors.

From: chad@norge.enet.dec.com
Message-ID: <14128@shlump.nac.dec.com>
Source record: 239478

In response to BobR.

Just to clarify.

There are a lot more machines than just Apple, Commodore, and Atari using 68XXX. Sun and Apollo have/had workstations using 68XXX. The Next machine uses it. DEC had a machine using it (though not popular -- VAXstation 100), even IBM had a machine (some PC looking thing). And I've probably missed a lot of them. There are also MIDI keyboards that have 68000 in them. It is a widespread machine. And it isn't PCs that keep IBM in the "Big Black", it is "Big Mainframes".

Chad

Message-ID: <12610335995028@osu-20.ircc.ohio-state.edu>
Source record: 239479

Let me summarize the past few days in this group:

The 680x0 blah, blah, flame, and all computers designed around the 680x0 are clearly superior...blah, flame, [list of reasons], drone, etc...

Followed by:

The 80x86 line of processors is so great that a puddle of slime would see the blah, blah, drone, flame, flame, drone, [knee-jerk reaction to earlier post], blah, etc....

and on, and on, and on.....

THIS IS GETTING RIDICULOUS!

This board is for Atari ST related posts. If I
want to ennumerate the differences between the micro-processors
from different companies, I'll buy a book or get their sales literature.

Please take further 'discussion' to e-mail or alt.flame (whichever is more appropriate!).

Tyler

1110. Re: Does Windows 3.0 work on any IBM emulator?

Newsgroup: comp.sys.atari.st
Date: 1990-08-01 16:13:50 UTC
From: patrick@hpmcaa.mcm.hp.com
Message-ID: <760019@hpmcaa.mcm.hp.com>
Source record: 239480

YES!,

I've successfully installed Windows 3.0 with PC-Ditto II. It runs at an acceptable speed. It does _a_lot_ of disc access due to running in REAL Mode without any expanded or extended memory. I have had a problem with the system locking up / and reporting a memory overflow error. This was encountered when I was installing applications. I have also had the system lockup when moving the mouse excessively. This also happens when in standard applications.

It requires ~4 Meg of disk space.

I used the CGA Mode and the Serial Mouse selections in the Installation.

Hope this helps

According to the documentation, WINDOWS 286 is supposed to run without
any problems on Supercharger. I have no idea what WINDOWS 3.0 is, or if
it is for the 286 or 386, but I hope this is helpful.

>
>The point is that it really doesn't MATTER what CPU a product runs, if
>it's a success commercially...

Incidentally, I think I heard somewhere that some SUN computers
use 680XX chips. Is this correct? If so, I think this would be a definite
example of a 680XX being used "correctly".
Keep in mind there's a big difference between the 680XX series
and the 80X86 series; one of them is that the 680XX chips design went
towards generalized operations, microcode, etc., while the 80X86 (at least
the early ones) used primarily non-microcode, more specific operations.
I've done limited assembly for the 68020 and the 80286, and more extensive
work on 68000 and 8086 (so I can't really say about the 386 or 486). But
I do know I found the 680XX environment much more coherent and easier to
work in.
Furthermore, it struck me how improvements in the 680XX series were
primarily enhancements of existing microcode, plus addition of protected
mode operations and that sort of thing, while it seems like the 80X86 series
has undergone more radical changes. Which is a problem when you lock
yourself into a hardware-specific series of operations, rather than using
a more generalized microcode system. Sure, the latter takes more design
in order to gain the same speed, but frankly I'd bet that development on a
68040 (is that the newest one?) would be a lot more familiar and a lot
easier to me than development on a 80486.
Mind you, I'm not saying anything about the machines. I bought
an Atari ST because it fit my needs (still does). If I'd needed an IBM,
I would have bought one. One of my requirements for buying was a Motorola
microprocessor. At the time, I was very disappointed with the Intel series,
but I had consistently seen quality from Motorola (even though it often
went unimplemented; take the 6809 for example, which was several registers
and years ahead of the current standard 6502).
Take all this with a grain of salt. I just program on them, I
don't make them, so I'm probably wrong on a few points here.

>"Big Blue" is in the "Big Black" while Atari Corp is in the "Big Toilet",.
>not because of any choice of microprocessor CPU...

Have to agree there; but then again, Atari has done quite well in
the European market.

Somebody asked for a mouseaccelerator. I saw one yet, doubling the mouse
speed. Yukh! Not all pixels are accessable anymore. (Pressing the right
button would set the speed to normal, but some programs use the right mouse
button!).
Here's another accelerator. It comes from STart, a Dutch ST magazine.
It will speed the mouse following the formula: n * (n + 1) / 2, resulting
in the following mousemovetable:

```
mouse cursor
----- ------
0 0
1 1
2 3
3 6
4 10
... ...
```

The program is an acc. butdoesn't appear in the menu.

8086, then 80186, then 80286 --- Three versions to run full Unix.
Personally, I have never seen a 286 run full Unix. I was under the
impression that it took a 386 to do it right. I have seen a 286 run
Xenix though.

68000, then 68010 can run full Unix. Not bad, only the second version of the
architecture. Why not compare apples and oranges. The 68000 was the first
member of the series ... the 8086 was the first member of the Intel series.
Neither could run Unix.

>>architecture.
>>
>
>The 68010 runs UNIX? Are you referring to the long-gone Sun-2 line? Didn't
>Sun use proprietary memory management hardware for all their worksation
>lines all the way through Sun-3/68020? The 68010 is the second version of
>the architecture? What about the 68008?

68008 is a version of the 68000 family that has an 8 bit external bus. It is used for inexpensive systems that want the power of the 68000 instruction set, linear addressing space, multiple general purpose registers, numerous addressinig modes ... You know the kind of stuff the 80x86 processors dream of. The 68008 is not the "next in line" processor.

>
>WHO THE HELL CARES WHAT VERSION of the architecture can run UNIX? Does it

THAT WAS YOUR ARGUMENT IN THE FIRST PLACE ... rememeber !!!

>make sense FOR YOU to choose a 68000-based machine over a cheaper and much
>more powerful 386-based machine just because you think it took MOTOROLA fewer
>tries to make their chips capable of running UNIX?
>

Sorry, that was not my argument at all. I was just trying to tell you that this argument that you were making was using incorrect facts. I was only correcting you facts. Not arguing.

>>
>>The 80386 should be compared to the 68030, shouldn't it. Now do you
>>see why the Intel architecture is so limited. When compared to THE
>>CORRESPONDING member of the Motorola family, the Intel family falls
>>far short.
>>
>
>You still haven't told me WHERE it falls "far short" -- at what stage.

Granted, that was rather childish of me. ("My daddy is stronger that your daddy") The rest of what I said stands.

>There are too many ways to compare the processors. One could ask, "At
>what stage in each chip line could the chip run UNIX without any additional
>memory management hardware?" The answer there would be "80286 and 68030".

I don't know enough to refudiate this with facts, but I have been under the impression that this was not the case. Can someone else give use facts to support/refute this claim.

>The chip lines are too different to be compared feature for feature. What

Agreed.

>difference does it make anyway, since by the time the 386 and the 68030
>became available, the two lines converged in terms of capabilities.
>
>Your argument is like saying that the Lexus is superior to the BMW because
>the first version of the Lexus is comparable to the umpteenth version of the

Source record: 239490

I just US mailed the most recent version of Mark Williams C-compiled umoria to Jim Wilson. He is likely to put it on kukulcan.berkeley.edu for public access (it's strictly up to him). I'd just like to remind people that this is emphatically beta software, and not a final version (that's why I'm not posting it in the ST newsgroups). I think there are few ST-specific bugs, so reports probably belong in rec.games.moria. One thing I'd like comments on (email only please): I had to modify the curses package a little; partly because of a bug, and partly because I didn't want ^C to terminate the program. This is the same curses package as is available from panarthea. It requires a little familiarity with MWC to get it to compile at all; do any significant number of people want the directly compilable source posted in comp.sources.atari.st?

>far short.
>
I think a lot of people are misled by the Intel vs. Motorola numbering schemes. Just because the 80386 and 68030 have '3s' in their names, people automatically think them comparable. In terms of actual capabilities, the 68000 and 80286 _are_ comparable. The 8086 is only a little above the 6800 and 6502 in the evolutionary sense. The 68020 and 80386 are also about on par. With the 80486, the Intel family reached parity with the 68030 in terms of CPU power; but, the onboard FPU and cache (and MMU? I don't remember) give it more oomph than the Motorola chip.
Of course, talking in terms of "capabilities" automatically makes this subjective. However, I've seen the '386 vs. '030 argument crop up a few times before.

From: besst@unix.cis.pitt.edu
Message-ID: <26461@unix.cis.pitt.edu>
Source record: 239494

The Data General 10 (and its successor, the 20) both use 8086s (I think:
it might be 8088s). They are closer to minis then micros, since the standard
setup is a CPU unit containing hard + floppy + tape drives hooked up to various
devices, including terminals. I use them as instrument controllers, where 1
DG 10 can run 2 terminals, acquire data from 2 instruments (a GC and a Mass
Spec) and quanitate the GC run at the same time -- pretty impressive for an
obsolete CPU, eh? There is also a 80186 in the Mass Spec.
The low-level OS is something called IDOS, but I doubt that this is the
standard OS for the DG 10 -- does anyone else know more about it?
Brian

1125. 2 ?'s: Print spooler/redirector + Install Apps

Newsgroup: comp.sys.atari.st
Date: 1990-08-02 21:10:48 UTC
From: jimh@ultra.com
Message-ID: <1990Aug2.211048.16391@ultra.com>
Source record: 239495

Does anyone know of a program that can function as a print spooler
and allow redirection of the listing to a file? Shareware, PD or
commercial program references are welcome.

Also, I've never figured out how to get some programs to install
properly. In particular, arc and zoo. I want to click on a file
in the desktop and extract the archive, but no TTP dialog
box ever pops up. Can anyone help?

Thanks in advance.

1126. Supra 30 Meg Drive Problem

Newsgroup: comp.sys.atari.st
Date: 1990-08-02 22:07:03 UTC
From: dalessio@motcid.UUCP
Message-ID: <4337@feldspar23.UUCP>
Source record: 239496

When I originally bought my drive, the computer would always
boot from the floppy with the hard drive off. Then, due to a
disk problem, I sent my hard disk back to Supra and they
replaced the drive. Now I can no longer boot from the floppy
with the hard drive off. I must always unplug the hard drive
and then boot the ST. Otherwise the ST does not seem to recognize
the built in floppy. This happens even without any AUTO folder
programs or accessories. A friend has the same problem. Does
anyone know why this is happening and, more importantly, how
to fix it?

Computer: 1040STf (no upgrades)
Drive : Supra 30MB Hard Disk

Thanks in advance!

1127. TT

Newsgroup: comp.sys.atari.st
Date: 1990-08-02 23:07:21 UTC
From: marauder@nadia.stgt.sub.org
Message-ID: <1293@nadia.stgt.sub.org>
Source record: 239497

Today I saw the TT in its (current?) final version at a local dealer:

16 Mhz, 8 !! Mb ram, color Multisync monitor and 40 Mb hard disk.

The price is 6,500 german marks, which is roughly $ 3,800 at the current
exchange rate. My dealer said Atari is going to ship here in Germany after
the Atari fair, which means beginning of September as soonest release date.

By the way, the version I saw here was had an US keyboard.

Stefan.

>so, I'd like to know how well they work. I called up a sales clerk,
>and made her swear on the bible that the Micro drives do not require
>assembly or any additional parts or labor.

Perry,

I own one of them and it's great! She didn't lie, no assembly required.
They format and partition it for you and it comes in a shoebox style case.
I've taken it apart once and all they do is take an ICD Host Adapter
and attach it to a Seagate mechinism. After about a year, I've had no
problems at all (I have one of the first ones).

I just found out that they have a 44MB Syquest removable drive for $799,
yes, $799 complete. Additional cartridges are $99 at the time of purchase
or $109 later.

Would all the Atari bashers out there please be kind enough to refrain from your line of discussion. If you do insist please limit the distribution to the US where the topics may be relevent here in the UK there are no shortages of dealers or software infact there is probably more Atari stuff around than for any home mico (yes including Amiga, Mac, Apple 2, C64 etc.) The 32Mhz TT is a reality and will be for sale in a few weeks. (OK maybe 4 or 5 or ... weeks).

One other thing do you all out there think it is realy fair to compare a 386 IBM clone to an ST? The ST costs 280 pounds and the 386 will cost about 2800 pounds this price is an order of magnatude different.

In any case I am happy with my ST even if there where no dealers, there is plenty of good PD stuff around from all sources including the FSF (they officaly support the ST but not the MAC!).

So again please keep US relevent articles to the US.

The best mouse accellerator?

MACCEL //

I got it from the tos1.4 fix arc. (you don't need tos1.4 to run it).
The cursor moves slow when the mouse moves slow but fly's across the
screen with a flip of the wrist. It also comes with a built in screen
saver and only uses about 1/2 a kbyte more memory than the little
accelerator that was just posted.

btw - I'm getting tired of reading all these amigite generated responses.

Bill,

Probably the best set of utilities/enhancements/bug fixes can be found in the panarthea archives (archive-server@panarthea.ebay.sun.com). The filename is: binaries/volume8/rainbow. The file includes Poolfix, an accelerator, and a few others. I'm going to send a nice little program that allows for moving (as opposed to copying) files with the right button to comp.binaries.atari.st tonight. It'll show up in a while.

>
>Can I use Revolver to save a game to my harddrive and continue the game
>later? Is Switchback the only product for the ST that will do this?
>
>Thank You,
>Gregory Gibson

Yes! only if the game knows your hard drive is there, and you can boot up
the game with the revolver software installed, AND the game doesn't disable
the Shift-Alt keys, or use them for something else.
Omni-res uses a Shift-Alt-Help combination to change screen resolutions
and thus you can not change resolutions because Revolver steals teh interrupt
before the Help key is pressed. But it works.
the only thing I have found that doesn't work with Revolver OUTRIGHT is
WordUp 3.0!! It must be something with how WordUp uses high end memory
to store fonts. It must go over revolvers head and use the memory even
though it is in another memory partition, thus crashing before it even
lets you load a document. Very depressing consitering how long it takes to
load WordUp, it would be nice to have it _right_There_ via Revolver..
But alas, no. I know nothing of how switchback works.
Hope this is helpfull.

Organization: UF CIS Department

This is in reply to your request for experiences with the ST.

I find my 1040 ST to be one one of the best general-purpose computers
around. It suits all my needs. I use if it for Desktop publishing,
being a Journalism major, and I use it for Telecommunications. I own
several different compilers, and find the Atari's OS easy to use. I
don't like MS-DOS, and I don't like IBM. Atari was the only other
alternative, as far as I was concerned. To be honest, if I was to buy
anohter computer today, it would be an Amiga--but this is only because
of the declining support the 1040 is getting.

>I offer to "repair" my posting by summarizing and posting a list of relevant
>uses for a ST. Mail me your experiences, I will post them.

I'm sorry that you feel so badly about the Atari ST; and although you
don't feel that the machine is a general purpose machine, it has suited
my purposes just fine over the last few years.

First, I use my computer for programming; I'm in college working towards
a degree in computer science, and the programming environment of the ST is
very comfortable to me. We use GNU C on the Suns and Vaxen for our courses,
and the ability to run that very same compiler on my own machine is extremely
useful. I also use Mark William's C quite often.

Second, I use the ST for word processing; WordPerfect is quite adequate
at handling college-level project reports. I also have UltraScript
and an HP Deskjet, which allows me to print professional looking reports
with minimal effort from my own room.

Last, I use my ST for limited desktop publishing. I create flyers for
several undergraduate clubs with my own resources. The ability for me
to afford all of these things and still go to college was why I chose the
I chose the ST in the first place, and why I still have it today.

Source record: 239361

In the most recent Computer Shopper there are several places where
a Syquest 44Meg 20ms cartdridge drive is advertised for < $600.
It's a SCSI device and I've got a BMS card, so I should be able
to hook it up to my ST, right?

The only concern I have is that I'm not sure how the ST will
react to changing the cartridge in the Syquest. Is "media changed"
a SCSI command/message? If so, will the BMS (or PD ICD) driver
recognize the change? Or will I have to reboot to load a new
cartridge? The same goes for formatting -- will the BMS software
know how to format a cartridge?

Does Toad Computers supply special software to run their Toadfile 44?

Thanks all,

Dave Baggett
dmb%wam.umd.edu@uunet.uu.net

PS> I'm not affiliated with Syquest or Toad. Haven't even bought anything
from either yet...

1142. float <----> double??!@##@*@! GCC137

Newsgroup: comp.sys.atari.st
Date: 1990-08-04 16:30:54 UTC
From: bud@ms.uky.edu
Message-ID: <15763@s.ms.uky.edu>
Source record: 239362

Hi guys,
I'm installing Gnu C on my ST, and I've run into something a little
odd. Consider the following :

```
#include <stdio.h>
main(){
int i ;
double f,s ;
s = 0 ;
for ( i = 1 ; i <=10000 ; ++i )
{
f = i ;
s = s + 1/(f*f) ;
}
printf("%f\n",s) ;
}
```

When I compile this with 'gcc junk.c -o junk.ttp',
I get what I expect, about 1.644933. But if I change the
'double' to 'float', I get 0.00000. Now I'm an utter novice
when it comes to C, so it's quite possible I've just done
something goofy. Any ideas?
Thanks!

Bud

1146. Atari slanders Micro RTX and MT C-Shell

Newsgroup: comp.sys.atari.st
Date: 1990-08-05 07:22:31 UTC
From: david@bdt.UUCP
Message-ID: <4236@bdt.UUCP>
Source record: 239366

In the August 1990 issue of Start magazine there is an article called "Multitasking On The ST". In this article Frank Foster from Atari Corp. is quoted as saying that Micro RTX and MT C-Shell "[work] but not very well" and that all current multitasking systems for the ST are "kludges".

Micro RTX and MT C-Shell are products developed and marketed by Beckemeyer Development. These are multitasking software products for the Atari ST. They were first released in 1986 and have been steadily updated and improved upon since that time. Beckemeyer Development recently released a sharware version of Micro RTX so that all Atari ST users could have access to true multitasking. As anyone who uses these programs knows, the statement that they don't work very well is simply untrue.

Aside from that issue, is this any way to run a business Atari?

Beckemeyer Development released their first Atari ST software product in 1985. Beckemeyer Development is one of the few vendors that has been able to survive the turbulent Atari years. Most Atari ST software developers that existed at the beginning of 1986 are no longer in the Atari ST business. Many simply couldn't handle Atari Corp. policies and politics. In fact, it seems like only a handful of Atari employees were able to stick with Atari all these years. Frank Foster wasn't at Atari Corp. in 1986. (I think he was with another company at that time, one that produced Atari ST software, and I believe, does so no more.)

Do you think this is an appropriate way for Atari to treat their long-term loyal software developers? Atari expects vendors to produce software for their system and support it, while at the same time, they slander those same vendors in offical Atari Corp. statements to the press.

Personally I am outraged by these comments. I'm asking you to help support me and write Start Magazine and Atari Corp. expressing your reaction to these statements. There are only a few Atari ST developers left, and with practices like these, Atari is going to lose even more.

Thank you for your support.

1148. TT and Lattice C v5.0

Newsgroup: comp.sys.atari.st
Date: 1990-08-05 13:34:13 UTC
From: johns@maccs.dcss.mcmaster.ca
Message-ID: <26BC2055.28872@maccs.dcss.mcmaster.ca>
Source record: 239367

I had in mind to buy Lattice C v5 but I was a little leary after reading the box. How closely does it comply to the ANSI standard? I thik the wording on the box says that it conforms 'closely.' How close is close?

I talked to a dealer here in Canada yesterday about the TT. He is going to see it on Wednesday. We talked about the TT a little and he was very adamant that there is no such thing as a 32Mhz TT or a 32Mhz 68030 for that matter. He said Motorola might have licensed a 33 Mhz chip, but at that speed it is very unreliable and so we'll probably never see one. Personally, I take what this guy says with a grain of salt. A grain the size cows used to lick on, back on the farm where I come from. :-)

Anyway, what's the deal? Does this guy know what he is talking about or should I just ignore him? Thanks for the input.

business as usual, dave!

>Do you think this is an appropriate way for Atari to treat their
>long-term loyal software developers? Atari expects vendors to
>produce software for their system and support it, while at the
>same time, they slander those same vendors in offical Atari Corp.
>statements to the press.

atari is simply kidding themselves in the long run. but then, it seems they may not be in it for the long run anyway. software is EVERYTHING in their market. the box is just a commodity. look at how people compare platforms: $$$, MHz, MB, # ports, etc. they don't say anything about s/w, which is what all non-programmer users are (or should be) interested in. these buyers far outnumber programmer users, i'd say. if atari could put together a really good 3rd party s/w story (like the "big boys" do) then they could very possibly gain market share. they sell "bang for the buck", however, which has been a good strategy up until now. getting into the unix w/s biz, however, they'll need to point to 1000+ appliacations (like Sun and DEC and ...) to make any impact because joe home user is not going to shell out $4-5k for a computer just to get a VME slot, especially if he has nothing to run on it. and you'll never see the fortune 1000's buying significant volume of atari, either, especially without very good s/w. they'll go to IBM or Sun or DEC first, even if the box costs more because they know there is a s/w base to grow on.

actually, i really don't think atari cares much about anything but foreign markets, which is not a bad idea in itself, though it leaves the rest of us in the states somewhat out on a limb. still, i really can't knock atari for this since at least they are helping the balance of trade.

i suspect if this was an orchestrated remark, it was meant to draw attention away from the ST and toward the TT possibly. if not, FF was just not thinking...

>Personally I am outraged by these comments.

1151. Can you help an Atari novice ???

Newsgroup: comp.sys.atari.st
Date: 1990-08-05 22:13:06 UTC
From: panisset@mcgill-vision.uucp
Message-ID: <1990Aug5.221306.19096@larry.mcrcim.mcgill.edu>
Source record: 239370

OK, here is a query for all you ST gurus... I know nothing about the ST (OK, I know it runs a 68000 :-), and recently someone asked me about getting rid of an Atari 520ST with color monitor (it was never used...). So my question is, is the 520ST still usable? Does current ST software run on it? Is there a way to increase RAM from the current 512K? What about hard drives? I saw in the docs that it has a HD port: is this SCSI? Can a SCSI drive be somehow convinced to work with the ST?
If the answer is that the 520 still has some life in it, then how much money should I give this person for the ST + color monitor? (It would be nice to have both a 386SX and a 68000 box on my desk :-).

Thanks in advance for anyone who takes time to answer these very basic questions. Got to start learning somewhere...

JF

1152. Word Up! 3.0 printing problems

Newsgroup: comp.sys.atari.st
Date: 1990-08-05 22:51:45 UTC
From: dnd15j9z@umiami.miami.edu
Message-ID: <6703.26bc6ac1@umiami.miami.edu>
Source record: 239371

Yesterday, I purchased Word Up v3.0. From my impressions so far, it is an excellent Word Processor. I am used to Macintosh WP's, and it acts just like one, save the speed. Anyhow, when I tried printing, it would not work. I have a panasonic kx-p1090 printer, and installed the program using the epfx_hi.sys printer driver, which is what it says to use for my printer. Anyhow, is there a bug in the program or something? I could SWEAR that I saw a couple of files on a local board, with the lines 'word up files to fix the printing errors' or something like that, but they arent there anymore. I will call Neocept tomorrow, but am just wondering if anyone knows here.

Actually, someone from Atari talked a little about their marketing thoughts and the TT. It has 2 major markets:

1) upgrade for the existing ST "power user". You can run most all ST software on it, so there's your software base.

2) low-end Unix workstation. For many government bids, source-level compatibility is all that's required. For other bids, you don't need to bid lots of software, depending on the niche you're trying to attack. For example, my department only bought 2 pieces of software for our Suns: FORTRAN and IDL.

For the rest of the market, they do have a developer's program which requires you to cough up $$ up front but allows you to buy hardware for cheap. I don't have any idea how many software people are taking advantage of this. We'll have to wait until the TT actually hits the shelves.

As usual, we aren't going to find out what's really going on until the TT hits the shelves. We can sit around all day guessing about things we don't know, and we won't get anywhere.

Hopefully, my name's not recognised as being an "Atari Cheerleader" or
"Atari Nay-sayer" (both misnomers IMHO) but...

I would love to believe that Atari has the current user base in mind
with regard to the TT. An excellent confirmation of this would be to
announce an upgrade path for the ST so that ST owners could migrate up
to the TT. However, if track record is any indication...

(I know, if Atari is changing (or is about to change) to become a
better company, then track record can't be any indication because it
no longer reflects the attitudes of the company. Also, my view of the
track record involves the situation in the US which, as we all know,
is not universal.)

Still, I can hope.

I have a Megafile 44 which I can comment on: If I change the cartridge a media change is recognized. However, I can continue working with the new cartridge only if it is partitioned the same way as the boot cartridge. If the partitions have different sizes a reboot must be done.

It just came to my attention that Arcgsh V3.0 has not yet been posted to
comp.binaries.atari.st because Steven Grimm did not receive it when I
sent it to him on June 1st. I on my side did not get any error message.
The reason might be that I "posted" it to comp.binaries.atari.st which
should be transformed into ordinary mail to the moderator by the news system.

I have just sent Arcgsh V3.0 off to Steven again. Hopefully he will
receive it this time.

Thank you for your patience.

Don't believe him. The Macintosh II-FX has been shipping with a -40- Mhz
68030 for some time now, and I can tell you it's perfectly reliable (we
had one running for 18 days straight on a major problem with no trouble.)
Motorola has always done good design work allowing their chips to be
excessivly over-clocked.

> they don't work very well is simply untrue.
>
Could you give us more information on Micro RTX. I was under the
impression that programs had to be specifically written to run
under Micro RTX. Is this true? From your post, it would seem
that I'm mistaken.

In either case, what software is known to run under Micro RTX?
Where can I get Micro RTX? How much memory should I have to run
Micro RTX properly? Is it known whether Micro RTX will run on
a STacy? How about the STe? Or even the TT? If it runs on the
TT, does it use the built in memory protection?

Any help in this would be appreciated.

PackBits Compression Algorithm

Introductory Information
----
word = 2 bytes
long = 4 bytes
palette = Hardware color palette, stored as 16 words. First word is
color register zero (background), last word is color register
15. Each word has the form:

Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 0 0 0 0 R2 R1 R0 0 G2 G1 G0 0 B2 B1 B0

R2 = MSB of red intensity
R0 = LSB of red intensity

G2 = MSB of green intensity
G0 = LSB of green intensity

B2 = MSB of blue intensity
B0 = LSB of blue intensity

Intensity ranges from 0 (color not present) to 7 (highest
intensity).

Example: { red = 7, green = 3, blue = 5 } -> 0735 (hex)

Caveat: It is wise to mask off the upper four bits of each
palette entry, since a few programs store special

information there (most notably Art Studio).

The Formats

<NEOchrome> *.NEO

1 word flag byte [always 0]
1 word resolution [0 = low res, 1 = medium res, 2 = high res]
16 words palette
12 bytes filename [usually " . "]
1 word color animation limits. High bit (bit 15) set if color
animation data is valid. Low byte contains color animation
limits (4 most significant bits are left/lower limit,
4 least significant bits are right/upper limit).
1 word color animation speed and direction. High bit (bit 15) set
if animation is on. Low order byte is # vblanks per step.
If negative, scroll is left (decreasing). Number of vblanks
between cycles is |x| - 1
1 word # of color steps (as defined in previous word) to display
picture before going to the next. (For use in slide shows)
1 word image X offset [unused, always 0]
1 word image Y offset [unused, always 0]
1 word image width [unused, always 320]
1 word image height [unused, always 200]
33 words reserved for future expansion
16000 words picture data (screen memory)

32128 bytes total

<NEOchrome Animation> *.ANI

NOTE: To get this feature on versions 0.9 and later select the Grabber
icon and click both mouse buttons in the eye of the second R in the
word GRABBER.
Interestingly enough, some versions of NEO only require you
to press the right button, not both. Hmmm...

1 long magic number BABEEBEA (hex) (seems to be ignored)
1 word width of image in bytes (always divisible by 8)
1 word height of image in scan lines
1 word size of image in bytes + 10 (!)
1 word x coordinate of image (must be divisible by 16) - 1
1 word y coordinate of image - 1
1 word number of frames
1 word animation speed (# vblanks to delay between frames)
1 long reserved; should be zero
----
22 bytes total for header

? words image data (words of screen memory) for each frame, in
order

<DEGAS> *.PI1 (low resolution)
*.PI2 (medium resolution)
*.PI3 (high resolution)

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)

32034 bytes total

<DEGAS Elite> *.PI1 (low resolution)
*.PI2 (medium resolution)
*.PI3 (high resolution)

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words 128 - animation channel delay in 1/60's of a second. [0 - 128]
(I.e., subtract word from 128 to get 1/60th's of a second.)

32066 bytes total

<DEGAS Elite (Compressed)> *.PC1 (low resolution)
*.PC2 (medium resolution)
*.PC3 (high resolution)

1 word resolution (same as Degas, but high order bit is set;
i.e., hex 8000 = low res, hex 8001 = medium res,
hex 8002 = high res). Other bits may be used in the
future; use a simple bit test rather than checking
for specific word values.
16 words palette
< 32000 bytes control/data bytes
4 words left color animation limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag [0 = left, 1 = off, 2 = right]
4 words 128 - animation channel delay in 1/60's of a second. [0 - 128]
(I.e., subtract word from 128 to get 1/60th's of a second.)

< 32066 bytes total

Compression Scheme:

PackBits compression is used (see below). Each scan line is compressed
separately; i.e., all data for a given scan line appears before any data
for the next scan line. The scan lines are specified from top to bottom

(i.e., 0 is first). For each scan line, all the data for a given bit plane appears before any data for the next higher order bit plane. Note this is identical to the IFF 'BODY' image data.
To clarify: The first data in the file will be the data for the lowest order bit plane of scan line zero, followed by the data for the next higher order bit plane of scan line zero, etc., until all bit planes have been specified for scan line zero. The next data in the file will be the data for the lowest order bit plane of scan line one, followed by the data for the next higher order bit plane of scan line one, etc., until all bit planes have been specified for all scan lines.

Caveats:

DEGAS Elite's picture loading routine places some restrictions on compressed DEGAS files:

o Elite uses a 40-byte buffer to store data being decompressed.

o Whenever a control command is encountered, bytes are stuffed in this buffer.

o The buffer is only emptied when there are EXACTLY 40 characters in it.

The important conclusion here is that

No control command may cause the buffer to have more than 40 bytes in it. In other words, all control commands must end on or before the 40-byte boundary.

Any picture violating the last condition will cause Elite to get a bus error when the picture is loaded.

<Tiny> *.TNY (any resolution)
*.TN1 (low resolution)
*.TN2 (medium resolution)
*.TN3 (high resolution)

Several people have reported sightings of mutated Tiny pictures that do not follow the standard format, so let's be careful out there. What is described here is the format that David Mumper's original TNYSTUFF.PRG produces.

1 byte resolution (same as NEO, but +3 indicates rotation information also follows)

If resolution > 2 {
1 byte left and right color animation limits. High 4 bits hold left (start) limit; low 4 bits hold right (end) limit
1 byte direction and speed of color animation (negative value indicates left, positive indicates right, absolute value is delay in 1/60's of a second.
1 word color rotation duration (number of iterations)

}

16 words palette
1 word number of control bytes
1 word number of data words
3-10667 bytes control bytes
1-16000 words data words

42-32044 bytes total

Control byte meanings:

For a given control byte, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 127)
x = 0 1 word is taken from the control section which specifies
the number of times to repeat the next data word (from
128 to 32767)
x = 1 1 word is taken from the control section which specifies
the number of unique words to be taken from the data
section (from 128 - 32767)
x > 1 Specifies the number of times to repeat the next word
taken from the data section (from 2 to 127)

Format of expanded data:

The expanded data is not simply screen memory bitmap data; instead, the
data is divided into four sets of vertical columns. (This results in
better compression.) A column consists of one specific word taken
from each scan line, going from top to bottom. For example, column 1
consists of word 1 on scanline 1 followed by word 1 on scanline 2, etc.,
followed by word 1 on scanline 200.
The columns appear in the following order:

1st set contains columns 1, 5, 9, 13, ..., 69, 73, 77 in order
2nd set contains columns 2, 6, 10, 14, ..., 70, 74, 78 in order
3rd set contains columns 3, 7, 11, 15, ..., 71, 75, 79 in order
4th set contains columns 4, 8, 12, 16, ..., 72, 76, 80 in order

Note that Tiny partitions the screen this way regardless of resolution; i.e.,
these aren't bitplanes. For example, medium resoltion only has two bitplanes,
but Tiny still divides medium resolution pictures into four parts.

<Spectrum 512> *.SPU

80 words first scan line of picture (unused) -- should be zeroes
15920 words picture data (screen memory) for scan lines 1 through 199
9552 words 3 palettes for each scan line (the top scan line is
not included because Spectrum 512 can't display it)

51104 bytes total

<Spectrum 512 (Compressed)> *.SPC

1 word flag word [$5350 or "SP"]
1 word reserved for future use [always 0]
1 long length of data bit map
1 long length of color bit map
<= 32092 bytes compressed data bit map
<= 17910 bytes compressed color bit map

<= 50014 bytes total

Data compression:

Compression is via a modified run length encoding (RLE) scheme,
similar to DEGAS compressed and Tiny. The data map is stored as a
sequence of records. Each record consists of a header byte followed by
one or more data bytes. The meaning of the header byte is as follows:

For a given header byte, x:

0 <= x <= 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x <= -1 Use the next byte -x + 2 times

The data appears in the following order:

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

Decompression of data ends when 31840 data bytes have been used.

Color map compression:

Each 16-word palette is compressed separately. There are three
palettes for each scan line (597 total). The color map is stored as a
sequence of records. Each record starts with a 1-word bit vector which
specifies which of the 16 palette entries are included in the data
following the bit vector (1 = included, 0 = not included). If a palette
entry is not included, it is assumed to be zero (black). The least
significant bit of the bit vector refers to palette entry zero, while the
most significant bit refers to palette entry 15. Bit 15 must be zero,
since Spectrum 512 does not use palette entry 15. Bit 0 should also be
zero, since Spectrum 512 always makes the background color black.
The words specifying the values for the palette entries indicated in
the bit vector follow the bit vector itself, in order (0 - 15).

<Art Director> *.ART (low resolution only)

16000 words picture data (screen memory)
16 words palette
15 * 16 words 15 more palettes for animation

32512 bytes total

<C.O.L.R. Object Editor Mural> *.MUR (low resolution only)

```
16000 words picture data (screen memory)
(palettes are stored in separate files)
-----------
32000 bytes total

<Doodle> *.DOO (high resolution only)

16000 words picture data (screen memory)
-----------
32000 bytes total

<Animatic Film> *.FLM (low resolution only)

1 word number of frames
16 words palette
1 word speed (0 - 99; value is 99 - # vblanks to delay between frames)
1 word direction (0 = forwards, 1 = backwards)
1 word end action (what to do after the last frame)
0 = pause, then repeat from beginning
1 = immediately repeat from beginning
2 = reverse (change direction)
1 word width of film in pixels
1 word height of film in pixels
1 word Animatic version number (major)
1 word Animatic version number (minor)
1 long magic number 27182818 (hex)
3 longs reserved for expansion (should be all zeros)
--------
32 words total for header

? words image data (words of screen memory) for each frame, in order

<GEM Bit Image> *.IMG

1 word version number of image file [1]
1 word length of header in words [usually 8]
1 word number of color planes [1 for monochrome]
1 word pattern length in bytes [1-8, usually 2 for screen images]
1 word pixel width in microns (1/1000 mm, 25400 microns per inch)
1 word pixel height in microns
1 word line width in pixels
1 word number of lines
-------
? words header length defined in 2nd word of header

? bytes data

NOTES: If the image is a color image (planes > 1), the planes are stored
separately starting with plane 0. There is, however, no standard way of
storing the color palette. Some programs may save the palette in separate
files, some may extend the header. For this reason, you should never
assume the header is 8 words long, always get the header length from the
2nd word of the header. Also, the line width in the 7th word is the number
of pixels in a line. Since the data is encoded in byte-wide packets, the
```

actual unpacked line width is always a multiple of 8, and may be 1-7 pixels
longer than the length specified in the header.

For each byte x in the data section,

x = 0 Pattern/scanline run.
Read the next byte, n (unsigned).

If n > 0 then:
Read a number of bytes equal to the "pattern
length" word in the header. Repeat this
pattern n times.

If n = 0 then:
Scanline run. Data for the next scanline
is to be used multiple times. Read the
following record:

1 byte flag byte [$FF]
1 byte number of times to use
next scanline data

The data for the next scanline follows,
compressed normally.

x = 80 (hex) Uncompressed bit string. The next byte
determines the number of bytes to use
literally. The literal data bytes follow.

otherwise Solid run. The value of x determines
what to draw. The high bit specifies whether
the pixels are set or cleared. A 1 indicates
a byte-run using $FF, a 0 indicates a byte-run
using $00. The low 7 bits, taken as an unsigned
quantity, specify the length of the run in bytes.

<STAD> *.PAC (high resolution only)

4 bytes "pM86" (vertically packed) or "pM85" (horizontally packed)
1 byte id byte
1 byte pack byte (most frequently occuring byte in bitmap)
1 byte "special" byte
----
7 bytes total for header

? bytes data

The data is encoded as follows. For each byte x in the data section:

x = id byte Read one more byte, n. Use pack byte
n + 1 times.
x = "special" byte Read two more bytes, d, and n (in order).
Use byte d n times.
otherwise Use byte x literally.

```
<Imagic Film/Picture> *.IC1 (low resolution)
*.IC2 (medium resolution)
*.IC3 (high resolution)

4 bytes "IMDC"
1 word resolution (0 = low res, 1 = medium res, 2 = high res)
16 words palette
1 word date (GEMDOS format)
1 word time (GEMDOS format)
8 bytes name of base picture file (for delta compression), or zeroes
1 word length of data (?)
1 long registration number
8 bytes reserved
1 byte compressed? (0 = no, 1 = yes)

If compressed {
1 byte delta-compressed? (-1 = no, > -1 = yes)
1 byte ?
1 byte escape byte
}
-------
65 bytes total for header (68 bytes if compressed)

? bytes data

Compressed data may be either stand-alone or delta-compressed (relative
to the base picture named in the header). Delta compression involves
storing only how the picture differs from the base picture (i.e., only
portions of the screen that have changed are stored). This is used to
to encode animated sequences efficiently.

Compressed data, stand-alone:

For each byte x in the data section:

x = escape byte Read one more byte, n. (n is unsigned).

If n >= 2, use the next byte n times.
If n = 1, keep reading bytes until a
byte k not equal to 1 is encountered.
Then read the next byte d.
If the number of 1 bytes encountered is o,
use d (256 * o + k) times. I.e.,

if (n == 1) {
o = 0;
while (n == 1) {
o++;
n = next byte;
}

k = n;
d = next byte;
```

```
Use d (256 * o + k) times.
}
else {
d = next byte;
Use d (n) times.
}

x != escape byte Use x literally.

Compressed data, delta compressed:

For each byte x in the data section:

x = escape byte Read one more byte, n. (n is unsigned).

If n >= 3, use the next byte n times.
If n = 1, do the same as for n = 1 in
stand-alone compression (above).
If n = 2, then set n = next byte.
If n = 0, end of picture.
If n >= 2, take n bytes from base
picture.
If n = 1, do the same as for n = 1
in stand-alone compression (above),
but take (256 * o + k) bytes from
base picture.

x != escape byte Use x literally.

<IFF Format> *.IFF

4 bytes "FORM" (FORM chunk ID)
1 long length of file that follows
4 bytes "ILBM" (InterLeaved BitMap file ID)

4 bytes "BMHD" (BitMap HeaDer chunk ID)
1 long length of chunk [20]
20 bytes 1 word = image width in pixels
1 word = image height in lines
1 word = image x-offset [usually 0]
1 word = image y-offset [usually 0]
1 byte = # bitplanes
1 byte = mask (0=no, 1=impl., 2=transparent, 3=lasso)
1 byte = compressed [1] or uncompressed [0]
1 byte = unused [0]
1 word = transparent color (for mask=2)
1 byte = x-aspect [5=640x200, 10=320x200/640x400, 20=320x400]
1 byte = y-aspect [11]
1 word = page width (usually the same as image width)
1 word = page height (usually the same as image height)

4 bytes "CMAP" (ColorMAP chunk ID)
1 long length of chunk [3*n where n is the # colors]
3n bytes 3 bytes per RGB color. Each color value is a byte
```

and the actual color value is left-justified in the
byte such that the most significant bit of the value
is the MSB of the byte. (ie. a color value of 15 ($0F)
is stored as $F0) The bytes are stored in R,G,B order.

4 bytes "CRNG" (Color RaNGe chunk ID)
1 long length of chunk [8]
8 bytes 1 word = reserved [0]
1 word = animation speed (16384 = 60 steps per second)
1 word = active [1] or inactive [0]
1 byte = left/lower color animation limit
1 byte = right/upper color animation limit

4 bytes "CAMG" (Commodore AMiGa viewport mode chunk ID)
1 long length of chunk [4]
1 long viewport mode bits (bit 11 = HAM, bit 3 = interlaced)

4 bytes "BODY" (BODY chunk ID)
1 long length of chunk [# bytes of image data that follow]
? bytes actual image data

NOTES: Some of these chunks may not be present in every IFF file, and may
not be in this order. You should always look for the ID bytes to find a
certain chunk. All chunk IDs are followed by a long value that tells the
size of the chunk. This is the number of bytes that FOLLOW the 4 ID bytes
and size longword. The exception to this is the FORM chunk. The size
longword that follows the FORM ID is the size of the remainder of the file.
The FORM chunk must always be the first chunk in an IFF file.

The R,G,B ranges of AMIGA and ST are different (AMIGA 0...15, ST 0...7),
as is the maximum number of bitplanes (AMIGA: 5, ST: 4).

Format of body data

An expanded picture is simply a bitmap. The packing method is PackBits
(see below), and is identical to MacPaint and DEGAS Elite compressed.

The (decompressed) body data appears in the following order:

line 1 plane 0 ... line 1 plane 1 ... ... line 1 plane m
[line 1 mask (if appropriate)]
line 2 plane 0 ... line 2 plane 1 ... ... line 2 plane m
[line 2 mask (if appropriate)]
...
line x plane 0 ... line x plane 1 ... ... line x plane m
[line x mask (if appropriate)]

The FORM chunk identifies the type of data:

"ILBM" = interleaved bit map
"8SVX" = 8-bit sample voice
"SMUS" = simple music score
"FTXT" = formatted text (Amiga)

<MacPaint> *.MAC

1 long version number [0=ignore header, 2=header valid]
38 * 8 bytes 8x8 brush/fill patterns. Each byte is a pattern row,
and the bytes map the pattern rows top to bottom. The
patterns are stored in the order they appear at the bottom
of the MacPaint screen top to bottom, left to right.
204 bytes unused
----
512 bytes total for header

< 51200 bytes compressed bitmap data

< 51712 bytes total

NOTE: The version number is actually a flag to MacPaint to indicate if
the brush/fill patterns are present in the file. If the version is 0,
the default patterns are used. Therefore you can simply save a MacPaint
file by writing a blank header (512 $00 bytes), followed by the packed
image data.

Bitmap compression:

The bitmap data is for a 576 pixel by 720 pixel monochrome image.
The packing method is PackBits (see below). There are 72 bytes per
scan line. Each bit represents one pixel; 0 = white, 1 = black.

<PackBits Compression Algorithm>

The following packing algorithm originated on the Mac, was adopted by
Electronic Arts/Commodore for use in the IFF standard, and then by Tom
Hudson for use in DEGAS Elite. The algorithm is currently used in
MacPaint, IFF, and DEGAS Elite compressed file formats. Each scan line
is packed separately, and packing never extends beyond a scan line.

For a given control byte 'n':
0 <= n <= 127 : use the next n + 1 bytes literally (no repetition).
-127 <= n <= -1 : use the next byte -n + 1 times.
n = -128 : no operation, not used.

---

* Roland Waldi contributed extensive information on the following formats:

GEM, IMG, Doodle, STAD, Imagic Film/Picture, Art Director, IFF

** John Brochu, ST picture formats guru, provided sage advice and many
corrections to the following formats:

NeoChrome, DEGAS Elite Compressed, Spectrum 512 Compressed,
GEM Bit Image, IFF, MacPaint

absolutely true, though based on the prices and performace i have seen
here, which are RUMORS until the machine comes out, as greg correctly
points out below, i don't think i'll plunk down $3-5k for 2-3x
performance boost unless i really needed VME or some other attribute on
the TT that the ST otherwise lacks.

>2) low-end Unix workstation. For many government bids, source-level

true again. often these contracts go to the lowest bidder and atari
could have a shot here, depending on perceived quality of the company
doing the bid. often this includes training, maintenance, etc, and
to my knowledge, atari does not have the chops here that say an ibm
or a sun or a dec would have, though for that very reason they could
offer a low bid.

> For the rest of the market, they do have a developer's program

> people are taking advantage of this.

i have, and in general have been satisfied with the support and certainly
the price of equipment. i can't complain. i have gotten upgrades,
access to private areas on GEnie and CIS, some documentation upgrades,
etc. the squeaky wheel gets the grease :-)

>As usual, we aren't going to find out what's really going on until the

1168. Re: Atari slanders Micro RTX and MT C-Shell

Newsgroup: comp.sys.atari.st
Date: 1990-08-06 19:11:14 UTC
From: david@bdt.UUCP
Message-ID: <4243@bdt.UUCP>
Source record: 239399

I spoke with Frank Foster at the San Jose World of Atari show this
past weekend, and he admitted to me that he has never actually seen
Micro RTX nor MT C-Shell and that he doesn't really know anything
about them. He also said the he is "just a marketing guy".

Well we all know it's really good marketing strategy to tell the
world your own possibly someday to be released product that doesn't
actually exist for sale yet is better than sliced toast and anything
that already exists which might be mentioned as possible competition
to your own product is a "kludge" and doesn't work very well, even
if you don't know anything about it!

Well of course, this clears the whole thing up! I don't remember
seeing a disclaimer that "Frank Foster doesn't really know what he's
talking about" in the Start article. I guess they're assuming that
this will be perfectly clear to anyone who reads the article.

I don't think so. Some people might just read that article and assume
that Frank Foster, the Atari Corp. representative, is the expert and
that he would know what works and what doesn't work.

It must be nice to have the power to blast any product you want, and
get it published in the largest ST magazine in the USA and get away
with it.

>lose even more.

I've seen some stupid remarks in START magazine quite regularely. For
example lately it was stated that Turbo C's new object format was no
improvement because 'noone needs external references of 32 characters'
as opposed to the 8 characters digital research's object format has.
I guess these people have no idea what they talk about, and
have never tried to port a source that consists of more than one file
to the ST.

About RTX: I don't have the C-shell, but the RTX kernel is very nice
and about the best multi tasking possible on a machine like the ST.
Minix with it's shadowing is too heavy for the ST.

I called Neocept and talked to them, and we figured out that the printer
drivers that they supply with Word Up will NOT work with the
panasonic kx-p1090, becase it doesn't do quad density printing.
so they are going to send me a new printer drive that does double density
bit image printing, I think its an MX_80 driver.

As I understand it, when you move a file, you are actually copying the file and then deleting the original (if this is wrong, PLEASE correct this). Would it be possible to make a patch that just changes the directory path of the file when moving it, rather then having to copy the entire file - this is especially helpful when the file is large, not to mention if you are pushing the limit of your drive size (500k left and you want to move a 600k file) or if your drive is already getting highly fragmented files.
So is it possible, or would the change have to come with TOS1.8 (TOS18?)?

>Actually, someone from Atari talked a little about their marketing
>thoughts and the TT. It has 2 major markets:
>...
>2) low-end Unix workstation. ...

Atari should market from its only position of strength -- bang for the buck.
Atari should not develop software -- they not have the will.

My thought for the day is that they should market a low-end sparc machine.
Let Sun write the OS and make the market. Atari should wrap the sparc
in plastic, throw in a keyboard, offer a black & white monitor or an 8 bit
color monitor (adding the Atari label to 3rd party suppliers). Offer the
system with an ethernet card OR a 100MB hard disk.

This would merge the pc and workstation markets. I'm sure Atari can enter
and surpass the Xterm market.

I suppose this position is too aggresive for Atari.

BTW, would some create the c.s.a.s.tech newsgroup again. I still don't
get it. The S/N here has dropped dramatically.

Very close, the compiler misses on trigraphs and wide characters. Also
the representation of float/double is not spot on. The libraries are,
as far as I am aware, fully conformant. The current release is
5.04.01, which these comments relate to. I should mention the product
is my responsibility.

I don't blame you for being sore, Dave. Not only was it a bad move on
Foster's part to say ANYTHING about RTX when he has never used it, but
it is just plain bad journalism for START to allow that sort of thing
in their publication. I think both parties should offer a published
appology.

>I've seen some stupid remarks in START magazine quite regularely. For

I don't have RTX at at all. Can someone give me some information on it?
Is there a demo anywhere to look at? An address to buy it/contribute
towards it should I see it to be the most awesome thing since sliced
toast?

Also, where do we send our gripe mail to Atari?

When you are moving a file to someplace else ON THE SAME PARTITION, you just
have to change directory information, you don't have to read the file at all.

>it be possible to make a patch that just changes the directory path of the file
>when moving it,
> [reasons for having a "smart" move deleted]
> So is it possible, or would the change have to come with TOS1.8 (TOS18?)?

Yes it's possible. It's also a standard feature of TOS 1.4, just hold the
CONTROL key down when you drag the file someplace. The mentioned "nice little
program" is only of use to those that have TOS < 1.4.

1183. (new) anonymous ftp site for TOS software

Newsgroup: comp.sys.atari.st
Date: 1990-08-07 16:06:20 UTC
From: roeder@sbsvax.cs.uni-sb.de
Message-ID: <5862@sbsvax.cs.uni-sb.de>
Source record: 239303

In the last few days, i have filled the atari-directory of our anonymous ftp-server at cs.uni-sb.de [134.96.7.254] with some interesting pieces of software for TOS:

- Of course we have the latest version of Emacs for TOS (as source, compiled and not dumped or the ready-to-use dumped xemacs) together with the gcc-library that was used to compile it.

- A preliminary port of Bash (without jobs, background processes and ulimit-setting).

- A TOS-version of Larry wall's perl (including gdbm-routines).

- Less for the ST.

I have included the file ~ftp/README below.

- Edgar

---------- cs.uni-sb.de:~ftp/README ----------

Universitaet des Saarlandes cs.uni-sb.de [134.96.7.254]
Fachbereich 14 - Informatik e-mail: ftp@cs.uni-sb.de
(Dept. of Computer Science)
Bau 36, Im Stadtwald 15
D-6600 Saarbruecken 11
Fed. Republic of Germany

Welcome to our anonymous ftp server.

Please note:

0. To retrieve files, you need the following programs
(and know how to use them):

a) ftp (hmm... you ARE reading this already, so I suppose you've got ftp)
b) 16-bit compress/uncompress in order to be able to uncompress files ending with .Z (available from the file compress.shar)
c) tar for files containing the string .tar in their name
d) sh (or compatible shell) for .shar files
e) cat (and output re-direction) for .split.?? files
f) for some strangely packed files you may need atob/btoa (available from the file atob.shar)

BTW our ftp server does understand the reget command, so in case your file transfer is interrupted you may wish to try that.

1. DO's

a) when asked for the ftp password, give your login@domainname
b) make sure your system hasn't got the stuff you want to get
c) make use of the /tmp directory for sending stuff
d) avoid ftping during prime time - that is Mon-Fri from
09:00 to 18:00 local time for machine load.

2. DON'T's

a) forget to set binary mode where appropriate
(especially with .Z and .tar files)
b) put anything in any directory other than /incoming
c) don't send a lot of stuff unless it's requested

Please note: * ATARI stuff (~ftp/pub/atari) is maintained
by Edgar Roeder (roeder@cs.uni-sb.de).
* NO MS-DOS stuff on this machine.

Feel free to contact ftp@cs.uni-sb.de in case of problems.

Frankly, in my fairly extensive experience with compilers, there aren't too many _truly_ ANSI C compilers yet. ANSI took several years to finally ratify a standard, so many compilers are what is known as ANSI Draft, which is an earlier version of the standard. In my opinion "close" is probably going to serve you pretty well unless you have a source file you need to port to the ST which utilizes some ANSI features not present in Lattice or other compilers.

Many companies have purchased 33 MHz 68030's from Motorola - I work with many VME boards, and virtually every VME maker has 33 MHz 68030 boards available. 50 MHz 68030's are available from a few vendors, also. I see no possible way the chip can be considered "very unreliable" - most of the major defense firms are using this chip in a wide range of projects. (Please, no flames about the potential lack of reliability or acuity among defense firms!)

|
| vovut@prism.cs.orst.edu
| ----------
```

You know, there's probably a real good reason that HDUTIL.PRG asks for the master disk! ICDUTILS are NOT in the public-domain, they are NOT shareware, they ARE copyrighted software that you are supposed to pay for.

I've said it here many times before, ICD has strict wording in their documentation that their software may not be placed on BBS nor may it be transferred from person to person, even if both parties are registered users. The only legal way to get the software is from ICD (by mail, or their BBS) or on GEnie. Period. Any other way is illegal. Period. So, no, there is no legal way anyone can mail you a newer version that works.

It sounds to me like ICD finally wised up and realized that just saying this wasn't enough, and now they've added some measures to protect against pirating. Three cheers for them if that's the case.

Now, what the heck are ICDUTILS doing on Terminator?

ps. Please direct junior-lawyer legal opinions to /dev/null. They won't do any good if ICD sics a real lawyer on the Terminator folks.

I've seen 50MHz 68030's in different literature so they can definatley
go that fast, and I believe 32MHz is correct, it was intel that went for the
odd 33Mhz

> Certainly, due to the 200pins of the 68030

Not that it's revelent to this argument, but the PGA version of the 68030
has 128 pins, the surface mount version around 132 pins.

>this is THEORETICALLY possible,

Theoretically speaking, any 68030 system could have 4 GB of memory, just as
any 68000 system could have 16 MB of memory. Practical considerations, such
as memory chunks reserved for I/O, OS, etc. will generally lower this number.
Physical realities may lower it some more.

>but due to the hardware constraints (limited card slots, bus width, power?:)
>just how much can you ACTUALLY address in the REAL world (no flames, this is
>an honest question)?

Today, as we speak, without building any additional hardware, I could plug
148 Megabytes of memory into my A3000. Since no one else has access to the
32 Megabyte expansion card (though all Developers who made it to the Amiga
DevCon last June have the schematics), the practical limit this moment is
18 MB total.

Based on 4MB CMOS DRAM technology, it's certainly possible to build 64 MB
of memory onto a single Zorro III card. It's also possible to fit at least
16MB on an A3000 Coprocessor Card. So based on today's available technology,
the practical limit is 290MB. This limit will of course grow as 16 or 64
megabit parts become available. The A3000 reserves 128MB for memory
devices that sit in the Coprocessor Slot, and 1.75GB for Zorro III devices.
This is, incidently, the first time Commodore has released a system that
will have to wait two memory generations before address space could again
be a limiting factor.

Fortunately, humans aren't changing nearly as fast as computers. Just about
everyone needs more than 64K of memory. A great deal of folks have been
satisfied with 1MB of memory (eg, the majority of PClone users). Most everyone

will be satisfied with 16-18MB of memory. The few who aren't should be happy with 2-4 times that 16MB chunk for the moment. Gradually, more folks will find a use for more than 16MB, but hardly in the volumes who found a use for more than 64K or 1MB. And this has all taken place in a single human generation; I can recall when I, personally, found a need for more than 16K of memory. Back in '79, 32K seemed practically unbounded.

> From what I understand, the 4k out of 4k colors obtained is due to
>software hacks (HAM methods, scanline interrupts, etc.), but I think that the
>question of comparing them is directed at standard system constraints rather
>than at what can be done by tweeking the normal draw cycles.

HAM, the 4K out of 4K they're undoubtedly referring to, is a standard hardware display mode on the Amiga. HAM does allow each pixel on the screen to display a different color, however, not an arbitrary color. The color of each successive pixel is based on either 1 of 16 random colors from the CLUT, or a R, B, or G modification of the color from the previous pixel.

There are apparently "dynamic modes", or hacks, used on the Amiga for more colors in other standard display modes. Some simple ones may use the display coprocessor to change colors, though I suspect the more advanced ones use a display interrupt and have the CPU bang the color registers. In any case, I suspect the same kind of things can be done on other systems with reasonable display hardware (even the C64 had a primitive scan line interrupt), so these must certainly NOT be considered standard display modes. A good comparison between systems might indicate that the display hardware has additional features, such as scan-line interrupts, a display coprocessor, or a bimmer/blitter.

(Note-- I tried to forward this text to mwca!bill, but I'm having server problems in sending it to him, so I'll post it for everyone to read anyway... if you aren't interested in Populous, hit that 'n' key now!)

>Can anyone tell me what the world name is for level 8? It looks like >Eordnord, but I'm using a Video Key and the text isn't real clear; I tried >to enter Eordnord but it wasn't accepted - anyone know the right name?

Yow! Another populus player exists out there!! I'm at work right now, but when I get home I will take out a list of the levels I've been to, and send you the info on level 8. That will be in about six hours. (I've been past level 50 and still goin' strong!)

>
>On a related note, any general pointers as far as overall strategies would >be helpful. For example, is it worth expending the extra manna to build up >my land so floods don't wipe out my people? When are castles preferable to >lots of huts?
>

I have rarely been to a point in the game that the computer is so strong that he is capable of flooding me, although this has happened to me a few times. In order to prevent flooding I tend to try to start out my initial people on high ground, and raise the land around them to make a high plateau. Of course, some of the people go for lower land as I'm expanding around, and I don't worry about these things too much.

Castles vs. lots of huts: Castles give you FAR more manna than any combination of huts, and when a tribe emerges from a castle, it is mega strong compared to tribes created from any other type of building. The tradeoff (and it IS serious) is that people emerge from castles by FAR more slowly than other huts, preventing you from expanding rapidly into new areas, which in turn restricts your influnce (i.e. raising / lowering land) in those areas. I have found a good strategy is to keep the land 'bumpy' enough around your inital area so as to keep the buildings more primitive and quickly produce tribes to colonize the surrounding areas. Once the 'first wave' of settlers have built buildings, I turn just *one* of them into a castle-- one castle is sufficient enough to provide enough manna for unlimited raising / lowering of lands. As my tribes expand over the wilderness, I keep my perimeter buildings on the primitive side in order to insure a quick supply of colonists, and begin flattening land in the nucleus of my "empire" to create high-manna producing castles. I keep repeating this process for my expansion policy.....

A warning about knights (for both you and the computer):
Knights may sem like a great way to conquer the enemy; you create one, and it does all the destruction unaided! The bad side effect of this is that when a knight burns down a building, it is treated as a "rock" and makes for bad growth if you desire to colonize an area near it. To make matters worse, the land which was providing the enemie's building with food is *ravaged* and turns just a *slight* difference in it's pattern-- if you are having problems reading the name on the screen (which I sometimes have with my *normal* monitor) you probably won't see the difference in pattern. The 'ravaged' lands will never be used for agriculture until it is raised/lowered and then flattened again. A castle consumes about 20 squares of farmland; if it is destroyed by a knight, all 20 squares become useless (until altered) and the castle is turned into about 10 sqaures of rock. which can only be removed by reducing the land down to sea level, which can be a lot of work. The morale of knights is to be wary of the consequences of using them on lands you may want to take over-- if you want to capture enemy strongholds, put your holy symbol on it and have your tribes do the rest as they will capture the building, not just destroy it.

When you get to levels where the computer starts chugging out knights, (around level 44+, I believe) don't panic! Computer knigts are very stupid in that you can lower land around them and drown them our easily, removing all problems associated with them. :-)

And last but not least, there is an undocumented wandering monster creeping the plains of the game! It totally freaked me out when I saw it!!! I've seen it mainly in the deserts, and once in a ice scenario; the moster travels straight up-and-down, which means that relative to the angled "gameboard" it is travelling at a diagonal. In the desert scenarios it appears as a giant slime creature (!!!) and leaves a trail of swamps after its path. I guess it's undestructable-- I've never been in a position to attack it. The thing sure laid waste to one of my civilizations in the game....

Hope that helps ya! I'll send the codeword to level 8 in about six to ten hours from now if you still need it. Populus is a fine game, and I have been entertained by it quite a bit. I also purchased 'the promised lands', which is not as stunning as I had thought it would be; all it does is load a different graphic set over existing maps. I had thought it contained *new* maps to conquer, but it just puts a different face over the maps containd on the old populus maps. Some of them are somewhat attractive though-- I like 'computerland' which has different brands of Atari computers (the old 800 is the most primitive one, all the way through the Atari 800XL, 1040, Mega-4, TT, and some workstations) with atari flags on them vs. similar Commodore computers with little commodore flags! Kinda cute.

Anyway, I've blathered on enough now about the game......

Will reply later,

In article <713@cvbnetPrime.COM> jshekhel@feds19.UUCP (Jerry Shekhel) writes:

>Excuse me, but even the 68020 does not have full VM support. That's why
>it requires a 68551 MMU to run UNIX.

A Microprocessor's VM support has nothing to do with whether or not it's
MMU is internal or external. A Microprocessor supports VM simply if it
can fully recover from a page fault during an instruction. Some micros,
such as the 68010-30, handle this by taking an exception when a page fault
is detected, with the internal state of the CPU stored. The page is brought
into memory, and the instruction continued right where it left off. Others,
such as the 68040, take an exception with less context information available
and actually restart the complete instruction after the page is brought into
memory.

An internal MMU does three things for you:

1) Usually improves translation times, since on-chip delays are always
considerably less than delays between chips.
2) Simplifies system design.
3) Standardizes the MMU along with the CPU.

Point #2 is perhaps the most important for Personal Computers in general, and
point #3 is important if you're trying to be a clone of something, such as
"IBM Compatible", but it makes little difference to Sun, Commodore, or anyone
else making their own OS releases. Point #1 can be minimized in other ways,
such as by employing external logical cache. Note that both 68020-based Sun
3's and SPARC based Sun 4s (eg, SparcStations) use external MMUs. Motorola
88100s and some other RISC chips also use external MMUs. They are not a big
deal, and certainly have nothing to do with the ability to run UNIX. In fact
the first Apollos, which did support virtual memory, used a second 68000 as
an exception processor to handle the problem of no virtual exception context
inherent in the 68000.

>Programmers don't have to worry about these things even at the machine
>language level!

Unless you're writing the OS, you as programmer don't worry about how the MMU
is implemented, either.

>I wasn't talking about supervisor mode. I was talking about hardware
>support for multitasking with an isolated memory space for each process.

Multitasking, separate process spaces, and virtual memory are all separate
issues. UNIX-like things such as OS/9 have been used for years without
translating MMUs. And a very simple MMU hooked up to a 68000 could run a
UNIX-like OS with separate process contexts as long as virtual memory isn't

an issue.

>But I still haven't come closer to understanding why people on this newsgroup
>hate the Intel processor, when the Intel/Motorola lines are so similar in terms
>of performance.

Perhaps it's the same reason one might choose a Porsche 944 over a Ford Mustang even though they can go at the same speeds. The Motorola architecture has been very clean all along. The Intel architecture has had ugliness grafted on top of ugliness. Although the modern Intel chips, the '386 and '486, are much closer to their Motorola counterparts in terms of native mode features, there are penalties based on the architectural baggage they're required to carry around. The '386 has 1/2 the machine registers of the '030, and they're less general purpose, and they didn't have room on-chip for any cache memory or split I/D buses. The '486, in order to support the way MS-DOS programs actually run, wasn't free to change any supervisor mode constructs, and it had to settle for a unified cache instead of separate I and D caches to support the self-modifying code used heavily under MS-DOS (the obvious advantage of separate I and D caches is that I and D fetches can occur in parallel, as they do for cache hits on the '030 and '040. Etc.). The Motorola MMU, not having to carry around all the segmentation stuff from previous generations, is a much better match to UNIX than the '386/'486 MMU, even though the Intel MMUs do have a minimal paging mechanism.

Most of this doesn't amount to much in reality, right now. C programmers on Motorola machines get more register variables, and UNIX runs a tad more efficiently on an '030 than a '386. On the other hand, in the PC world at least, most of the Intel machines sport external cache, whereas the 680x0 machine at best offer it as an option (out of NeXT, Amiga, Atari, and Apple, only the Apple IIfx comes with external cache). As a follower of this for quite some time, I think the 68040/80486 generation is where the clean architecture of the Motorola line is going to make a very obvious difference in performance, rather than the rather insignificant differences in the '030/'386 generation.

To answer your questions about Microrтx:

(This is from my head as I don't have the docs here)

1) Microrтx takes only a small amount of memory to run (about 40k)
so it will run on any atari ST.

2) Programs do NOT need to be recompiled to run under Microrтx as
it is installed at the interrupt level. I have found that most
of the tools I use and the software I've written run fine with
Microrтx installed.

In fact I use the MWC msh enviroment to write microrтx programs
with microrтx installed, this makes developing programs for
microrтx easy (well I hung the system initially, until I got the
obvious defects out, but then again I still hang the system
once in a while while programming under GEM). I believe Microrтx
is programmable from virtually any compiler/linker.

3) Microrтx doesn't implement any process protection scheme, but does
offer signals, message passing, file locking, and other OS extensions.
It also allows the programmer very low-level access to the machine while
still being TOS compatible.

4) There is a shareware version of Microrтx available at many archives.

-Joe Gilray

1194. Re: TT and Lattice C v5.0

I just heard from an American Atari dealer today that the TT will have a 32 mhz processor in it, but the system board will still run at 16 mhz. They will be doing this by implementing a cache along the same lines as the Fast T-16 board. I actually wonder how much of an increase in speed this will give us. Anyone care to guess?

Hi All. I'm seriously considering buying a Portfolio.. it's a pretty neat piece of work!.

I'd like some input on a few issues though.

It seems that all the dealers I've spoken with have the same deal going; $399 with a parallel interface (and I believe an additional card..?).. are there any dealers who's prices are almost always lowest (mail order houses?).

The dealers I spoke with mentioned very vaguely about public domain software that was available for the Portfolio, then quickly changed the subject when I asked them what kind and in what quantity (is this propaganda or is there really a reasonable amount of PD stuff for it?).

One thing that interests me is a terminal emulator for the little beast.. again the dealer says there is one in the PD, but was a no show when I asked for a demo.. does such a program exist (is it any good.. plain vanilla?)?

Does anyone know if Atari plan to produce a modem adaptor (rather than plugging in the serial card and then a modem, just a modem that interfaces directly to the Portfolio's interface bus)?

One more question (you can see that I got a huge quantity of information from the dealer :-) :-)).. is the display matrix reconfigurable to display 80 cols of text rather than 40?.. if not does anyone know if Atari is planning to release a version that does 80 cols?

Thanks muchly in advance for any info. If all this has been discussed before on the net, my appologies, and I would appreciate any e-mail replies or summaries, in that case, if not I look forward to reading any posted replies.

Stu.

I understand your concern, and was pretty concerned myself upon reading this
article. I just checked the copy of ICDUTILS we have on terminator. This is
the beginning of the READ.ME file included in the archive:
-=-=-=-=-=-=-=-=-=-

READ.ME 8/12/87

This file documents the ICD ST Hard Drive Utilities. These utilities are
packaged with all ST Hard Drive Systems and ST Host Adapters sold by ICD. They
are all Copyright (C) 1987 ICD, Inc., however, you are free to use and
distribute these utilities as long as:

1) They are not sold or included with any other product unless an
ICD Host Adapter is part of that product.
2) They are not modified in any way.
3) ICD is given credit for authorship of these files.
4) This documentation is included.

* Any company wishing to include these utilities with their products
must first obtain a license from ICD, Inc. or they will be in violation of
Federal and/or International Copyright Laws. Licensed will display the
license registration number.

If you have any questions:

ICD, Inc.
1220 Rock Street
Rockford, IL 61101

Voice: 815-968-2228
Modem: 815-968-2229
FAX: 815-968-6888
-=-=-=-=-=-=-=-=-=-=-
[remainder omitted -- hyc]

This is obviously very old software here. It also seems to me to be quite explicit in stating that it is freely distributable. ICD's policy may have changed since then, but no one has notified us. No one has posted any messages on any nets I read to the effect of "please remove your old copies of our software from your archive" either, so I think this is still OK.

I wouldn't trust it worth a damn, but I don't think there's any problem with distributing it.

This is wrong. In TOS 1.4 if when you drag files from a source to a
destination that are different disks, you do copy and then delete.
However, if it is to the same disk, it does not copy! you do not need
extra disk space to do this operation.

First of all ICD software < IS > copyprotected in the sense that
it will only work if an ICD host adapter is installed in the hard drive.

Second, as you mentioned, ICD has a user supprot BBS which has
for download ALL standard ICD utilities.

ICD's board will allow anyone to download this software. It is
unusable unless you have their host adapter anyway!

Why are you getting so hot under the collar about this software
that is clearly available to ICD owners? A lot to say about nothing.

ICD's BBS number is (815) 968-2229

From: ekrimen@wet.UUCP
Message-ID: <1427@wet.UUCP>
Source record: 239309

```
- I recently bought an ICD hard drive, and was surprised to find that
- Turtle gave me a fatal error message, even though I had turned off
- CACHEnnn.PRG. After much investigation, I found that the ICD hard
- disk driver, ICDBOOT.SYS, was the source of this new
- incompatibility. It turns out that my ICDBOOT.SYS was
- pre-configured to allocate blocks for read/write caching. I fired up
- HDUTIL.PRG, and re-configured ICDBOOT.SYS to disable all caching.
- Doing this made Turtle happy. I could then back up my hard drive.
- After that, I re-enabled the ICD caching, and CACHEnnn.PRG.

No need to load HD Util to enable and disable the cache. Just turn
it on, and when you want it disabled, hit ESC after ICDBOOT displays
its version number on boot-up (and before it lists the cache stats).
(What an ugly sentence, but I hope it got the idea across.) This
will temporarily disable the cache.

From: marshall@batserver.cs.uq.oz.au
Message-ID: <4526@uqcspe.cs.uq.oz.au>
Source record: 239310

Does anyone know of any printer and/or screen fonts for
"Publishing Partner", other than System, System Bold, Helvetica,
and Times? GDOS and Postscript would be appreciated, especially
Postscript. Pub.Domain or Shareware preferred, but commercial
would be considered. Also, where would I find them? Thanks.

Source record: 239330

Stephen Jacobs asks:

>I seem to post these questions a lot. But I'm hearing conflicting rumors.
>if anyone has seen a TT offered for retail sale ANYWHERE, please either mail
>me or post. I personally don't care nearly as much about the exact configur
>ation as about simple existence.

David Ramsden, programmer of some of the "Cyber" series of graphics programs for ANTIC, and one of the principal members of LEXICOR, the company that's doing some high-powered new graphics software and hardware for the ST, was at Atari Corp recently, and was told that the TT is NOT on sale anywhere in the world. This was as of about two weeks ago...

(Sightings of a TT in Canada, specifically in Edmonton, were of a prototype TT that's making the rounds of dealers in Canada... not for sale...)

Cheer up. The same can be (and is) said about TOS. TOS is the biggest kludge
I've seen to date. If TOS had not been in ROM somebody would have written a
better replacement long ago. A little more staff for an essential part of the
product would not hurt.

Adding multitasking as an afterthough is necessarily a "kludge". That does not
mean it does not work well. (I've written some multitasking code for the
beast myself, and it's tricky. But it runs on every version of TOS I've seen,
so it must be a fairly clean kludge.)

The HP 9000/370 sitting next to me as I write this uses a 32 MHz 68030. The
9000/375 (Now shipping) uses a 50 MHz 68030 and has provisions for a 25 MHz
68040 to be swapped in. HP is very conservative so if THEY are shipping
50 MHz 68030's, they must not only be real, but RELIABLE!

I don't think it really matters what kind of performance increase the 32MHZ 68030 will yield. Atari will now be able to claim a 32 MHZ processor and that should be enough to satisfy all the people ranting and raving about the TT having "only" a 16 MHZ processor.

Message-ID: <4288@bdt.UUCP>
Source record: 239316

In article <2070.26bd2888@miavx1.acs.muohio.edu> kacovert@miavx1.acs.muohio.edu writes:
>Could you give us more information on Micro RTX. I was under the
>impression that programs had to be specifically written to run
>under Micro RTX. Is this true? From your post, it would seem
>that I'm mistaken.
>
>In either case, what software is known to run under Micro RTX?

Most software just runs as is, and you don't have to do anything to it
to get it to run. The list of programs that runs is so long I can't
list everything here, but here are some of the more commonly known titles
(off the top of my head):

GEM apps:
Pagestream
Calamus
Touchup
1st Word
EZ Draw
Opus
Stalker
Flash
Just about any GEM app.

Utilities:
arc
zoo
kermit
Many well-behaved TOS apps.

Compilers etc:
Mark Williams C
Alcyon C
Lazer C
Sozobon C
GNU GCC

Most what doesn't work are games and other programs that "take over"
the hardware and bypass the OS system calls.

Programs that want to use the extra system facilities (e.g. interprocess
communications, installable device drivers, or perhaps real-time
events), would need to be written specifially to use those RTX services
that they need. These programs can be set up to even detect the
presense of RTX and work even with the system, in a "sub-set" fashion.

>Where can I get Micro RTX? How much memory should I have to run
>Micro RTX properly? Is it known whether Micro RTX will run on
>a STacy? How about the STe? Or even the TT? If it runs on the
>TT, does it use the built in memory protection?

Micro RTX is available from ST binaries archive servers, Compuserv, GEnie and the BDT BBS (415) 530-9682. To run the basic RTX kernel you don't need very much memory; it really depends on the size of your RTX apps. The Micro RTX shareware distribution contains information that you should find helpful.

I do have customers running Micro RTX on an STe. There are minor problems, mostly related to disk access that may or may not be related to Micro RTX. I don't know for sure yet, since I only have one reported problem with one STe customer. There are roughly 50 STe systems that I am personally aware of running Micro RTX. I have no idea how many STe users may be using the Micro RTX kernel and I don't know about it.

The TT doesn't exist yet, and therefore Micro RTX doesn't run on it. If the machine is ever released there are plans to develop a TT compatible Micro RTX. I don't have a TT and I do not know when (if) I will get one.

^^^^^^^^^^^^^^^^^^

Why doesn't a third party company make a replacement TOS?
I wouldn't mind loading up a new ROM from disk, it would be a lot better than
loading a whole bunch of patchs and little improvement programs. Micro RTX
should be built in standard. Neodesk should be the standard desktop.
Why doesn't Atari just hire some of the third party developers to work on
the ROMs. We could have the Code Heads optimizing it and put in a new
version of G+Plus that supports ultrascript fonts. If people want the
OS to be on ROM, burn it into a Cartridge. It holds 128k, and I am
pretty sure that if the ROMs were optimized a bit they could fit it all
in there, if not it could bank select the extra memory.

Atari should get off there butt and give us some decent ROMs! The TT better
come with a really improved TOS, but it will most likely be the same old
ROMs just modified to run on a 030. Oh, well. :(

Re: ICDUTILS on Terminator

Given the preamble to the documentation for the programs available on Terminator (posted by Howard Chu), I agree that the programs are legally available on Terminator. My apologies to the original poster and to the Terminator folks; I was not aware that ICD's earlier policies were more lenient than their present policies.

To address the question posed by Mr. Tauberg:

> Why are you getting so hot under the collar about this software
> that is clearly available to ICD owners? A lot to say about nothing.

The current versions of the ICD programs come with documentation that clearly states how they may be distributed, and ICD has made it clear on GEnie that they are serious about it. As a case in point, there was a fellow that asked permission to give a copy of the latest utilities to a pal who had an ICD host adapter. ICD flatly refused, saying his friend had to download them from GEnie or ICD's BBS, or else mail-order and upgrade.

One can certainly question what is admittedly a strange distribution/upgrade policy, but one can't question ICD's right to set that policy. And I don't think a BBS or file server could afford to engage in practices contrary to ICD's policy, in light of some of the serious piracy incidents that have recently come to light involving software written for the ST.

So, "hot under the collar" perhaps, but please direct your "alot to say about nothing" comment elsewhere.

Don't know much about the JRI system, but I saw it in action at The World of Atari in San Jose last weekend, and it looked real nice. Live video with computer generated color graphics laid on top.
In case someone doesn't know, genlock allows a computer to sync to an external vido input, so that the two can be mixed together.
As I said, the JRI unit looked real crisp. they had a three-dee animation of the word 'genlock' spinning over the output from a camcorder.

...that's all I wrote!

There are dozens of "clients" which come with the MIT X distribution. Perhaps you meant to ask whether anyone ported the X server to the ST?
I, too, asked this question some time ago, but got no answer (well, I seem to recall someone in Germany mentioning that he/she was working on a server port -- but don't know what came of it.)

It would be interesting to see an X port on an unmodified ST. You almost _need_ multi-tasking to run the X Server and a reasonable number of X clients - although, I suppose with creativity, you could run the server as an "accessory" and a single X client from the desktop.

If you intend on using the ST as an "X Terminal" (ie. just run the X server), your server would have to know either SLIP (serial line Internet Protocol) if you connect another machine running X clients via the ST's serial port _or_ TCP/IP if you can find an ethernet board for the ST.
In either case, you need at least one other machine to do anything useful.

Sorry I can't be of more help,
Tom

1223. Keyboard Scanning

Newsgroup: comp.sys.atari.st
Date: 1990-08-09 09:31:51 UTC
From: adp@csug.cs.reading.ac.uk
Message-ID: <2737@onion.reading.ac.uk>
Source record: 239346
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hello,
I wonder if anybody out there could help me with a small problem. I want to scan the ST keyboard directly, ie obtain from it the codes for keys up and down, and (possibly) bypass the usual keyboard scanning routines. I need to do this to find out when keys are pressed simultaneously.
I noticed a bios (xbios ?) call that returned an address of a pointer table to various input routines (such as mouse, MIDI, input etc).
Is it just possible to save the keyboard vector (the last one?), plug in my own for a while, and then reset the original vector on exit? What, if any, special properties does one of these vector routines require? Will it be possible to still use a debugger (MONST2) to trace the program even when the keyboard input routine has been moved, and if not what could be done?
Any help will be appreciated, source code or explanations, either emailed directly to me, or on the net.

Thanks,
Andrew

It's like a poor man's version of X. It multiplexes several tty sessions over a single serial line. It's good for editing many files in many windows, using vi on a host that doesn't have emacs. It's useful any time you want full terminal access to multiple applications simultaneously.

This is a common problem, which is why I followed up with a posting instead
of e-mail. The make program is picky about tabs. Do not replace them with
spaces.

The format is:

final_form:<tab>list of its constitutent parts
<tab>command to make the final form from the parts
<tab>more optional lines of commands

String variables that work like environment variables can be defined
at the top of the makefile, then plugged into the lines that describe
how files are related.

Here is an example makefile. The bottom two lines are generic. The
entries for post060.zoo and post060.uue demonstrate how make can
manage programs other than a compiler. (I'm also using make to manage
a documentation project in which the chapters are stored in
individual files.)

```

I have used a version that was modified to run on a color machine.
But it's not very useful. I had difficulty reading most of the UW
fonts in color.

There is an alternative: an application called "screens" that runs on
the Unix machine can let you "flip" among several virtual terminals
by using a hot key. With that alternative, you get a full screen
rather than windows, which can be an advantage in some applications.
However, you can't watch the output of multiple programs under
screens.

any atari st system.... as far as I know!
>1.) Will it work with a color monitor?
No.
Yes. I have done it. Try a ``mono'' emulator and then only use either of the two largest fonts.

>2.) Will it work on a 512K Machine?
Probably, should be no trouble at all.
Yes.

>3.) Will it work without a hard drive? (x2 DS/DD Drives)
Sure, no problem.
Yes.

>4.) What EXACTLY is it useful for...?
It's like a poor man's version of X. It multiplexes several tty sessions over a single serial line. It's good for editing many files in many windows, using vi on a host that doesn't have emacs. It's useful any time you want full terminal access to multiple applications simultaneously.

It's great to play empire with your map in a window with a 4x7 or so font... and have this other window... a 12x4 (or 80x4) with a HUGH font...

I mostly use it with either 4 80x24 4x7font windows...
or overlapping 4 80x24 ?x13 font windows...

The only problem is that is there is a LOT of stuff going to one window... well, the others are lock. In other words, don't monitor ACTIVE files... like watchlogs.... or worse, get someone upset at you in IRC and have them shove a file down your poor multiplexed session... You will be locked up.

1228. Sprectre format disks AND disk utilities for the Mac

Newsgroup: comp.sys.atari.st
Date: 1990-08-09 17:31:37 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <4160@rodan.acs.syr.edu>
Source record: 239251

I think the Summary line pretty much says it all, but to rephrase: I was wondering if disk utilities made specifically for Mac formatted disks will work on Spectre disks? For example, a data recovery utility [like the one, say, in Mac Tools Deluxe]...will that recover files from a damaged Spectre-formatted disk? (running under spectre, of course). And would this type of tool (not necessarily a data recoverer, but let's say maybe a disk "defragger") work on a hard disk but not a floppy, on a floppy but not a hard disk? Or doesn't that matter?
Post to the net, or email me directly. Thanks very much in advance.

[...]

You mean, an X *SERVER*? To run X clients on an ST would only make
sense with a multitasking kernel with some form of IPC, and would have
as a prerequisite a running X server on the ST.

Roberto> Hi Phil !
Roberto> I once heard about such a thing named X/ST/Window or something
Roberto> like this, but I never could get some info on that.

If you do hear something more, please let me know.

Roberto> Perhaps someone out here can help us, as I'm looking for an X

>odd 33Mhz

No, actually, the 68030s are rated at 33MHz, and that's not an odd number.
The deal is, microprocessors aren't technically rated based on clock frequency,
since that's rather meaningless to designers, but on clock period. The
frequency numbers sound better, because folks like to equate "big" rather
than "small" with "better". In the case of the 16MHz part (16.667MHz
actually), the clock period is 60ns. Motorola also makes 68030s that clock
with clock periods of 50ns (20MHz), 40ns (25MHz), 30ns (33.333MHz),
25ns (40MHz), and 20ns (50MHz).

Re: Inserting Master Disk.
The reason the program asks for a master disk is that it is looking for the Icdboot.prg in the auto folder. I'll leave the solution as an exercize to the reader.;-) Also,for use on older Atari hard drives theres a progam around called ICDFIX which fixes the Ghost drive problem.
I think the reason ICD changed their policy on distribution was that as their software became so obviosly superior to all the competition,it was being used on every hard drive. I wish they allowed free distribution though,as they have it protected anyways and I hate paying to download it from GEnie. Besides, I hear it's available on pirate boards with the protection removed anyways.

Don't read if you don't want to know!!!

.
.
.

(its been suggested that I go back to the previous game and win by a different score so I can miss world 114, as it may be "flukily" hard.

> And last but not least, there is an undocumented wandering monster
> creeping the plains of the game!

He's *one* of the undocumented nasties. Yeah, he ate up a good number of my guys one game (not by leaving a trail -- he just slurped them up whole). There's at least one other. A magician on a flying carpet from Earth First has been seen several times planting long rows of trees. If one of your settlements happens to be in his way, Oh Well.

Other notes. The computer cheats. It never digs out rocks (at least not in the higher levels). If it moves the land level the rock is gone. As to my being stuck at world 114: The computer there is TOUGH. I can't rebuild the land fast enough to keep away from earthquakes. Swamps appear under my leader before I can dig them out. After I hold my own against the computer for about 20 minutes, he goes knight crazy. You can't drown 'em, and even if you manage to, that #$@! holy noise happens every 2 minutes or so. I honestly don't see how I'm going to defeat it.

Well, just my thoughts.

Well, I guess that's the way this economy works - when a company notices an
increased demand for their product, they're free to take advantage and raise the
cost of the supply accordingly.

Just because a program appears on a pirate board is sufficient reason for a
company to stop charging money for their product? Neat idea...

I can't help, but I think you both mean "server," not "client." An X server is the program which accepts drawing commands and puts a display up on your screen. X clients are the programs which send the drawing commands to the server.

Note that (I think) it'd be possible to implement an X server on the ST without the use of any multitasking system; since all it needs to do is listen for requests from somewhere (presumably a UNIX or similar system on the other end of a SLIP or Ethernet connection) it's the only thing that needs to run.

Finally, unless you do have Ethernet or some other reasonable-speed network connection to your ST, you are NOT going to want to run X. Even at 19200 baud, you'd find the system intolerably slow if you went through the serial port. Not that it wouldn't be a neat hack, but without some major compression or network hardware, an X server on the ST would be pretty useless.

Some months ago I asked Atari Germany about X/ST/window. They sent me a high glossing paper with some info. In short:

- X/ST/window is an X server for Atari ST, TT and ATW.

- The whole X Window System runs on Atari TT under ATX and on Atari STW under Helios.

- X/ST/window bases on X/ST/multi, "a multitasking operating system which is totally compatible with the TOS of the Atari ST" (literal translation from German). It allows discoupling of the time critical protocol processes from the graphical software.

- The ST monitor acts as a window and shows only a part of a virtual screen. The dimensions of this virtual screen is limited by memory only.

- Network access is done via TCP/IP.

Ah yes, and then they said it would be available at special computer stores by end of June 1990. Hmm, actually they said "90", not "1990". They don't mean 2090, do they? :-)

1242. Questions on PageStream

Newsgroup: comp.sys.atari.st
Date: 1990-08-10 11:59:54 UTC
From: klute@heike-fbi.informatik.uni-dortmund.de
Message-ID: <2396@laura.UUCP>
Source record: 239262

I just ftp'ed the demo version of PageStream 1.8 from clotho.acm.rpi.edu
(128.113.10.204) and tried it out. Now I have several questions:

1. Where can I buy the full version and what does it cost? Is it available
in Germany?

2. Is there any newer version?

3. I tried to send the output in PostScript format to a disk file, but
this did not work. Is this a problem with the demo version only or is
this "feature" in the full version also? (Eventually I did it by
sending the output to the serial port with "jove" listening on the
Unix side.)

4. What fonts are available and where?

Thanks in advance!

Message-ID: <1990Aug10.142331.3217@msuinfo.cl.msu.edu>
Source record: 239264

OK, I'm convinced. UnixWindows sounds like a good program. Thanks for all the e-mail replies. Someone even sent me the Atari side of the program.

Now, can any kind soul send me the Unix side compiled on a Sun4? I realize that UW is on terminator, but isn't that the Atari side. I couldn't find the UNix side. BTW, when I tried to run the Atari side of UW, downloaded from atari.archive, I got the error message: "You do not have enough memory to run the application..."

1245. Atari Earnings

Newsgroup: comp.sys.atari.st
Date: 1990-08-10 14:55:59 UTC
From: saj@chinet.chi.il.us
Message-ID: <1990Aug10.145559.7427@chinet.chi.il.us>
Source record: 239269

Just to get this in before the New York person does: Atari's quarterly earnings appeared in the Wall Street Journal on Thursday, August 9. They reported 3 cents a share, vs 1 cent a share for the corresponding quarter a year earlier. The brief item gave me the impression that there may still be some 'creative accounting' going on to spread the losses from Federated over as long a time as possible. Anyway, the result was encouraging, but sure doesn't indicate entry into paradise.

In the same directory as the atari UW stuff is a file uw.tar.Z. This is the complete Unix source & documentation. The Atari source & binaries are in a separate arc file.

The uw.tar.Z file is a compressed tar file (obviously) and also contains source for the Mac client. (Not my fault, that's how it's distributed.)

From: jhenders@van-bc.wimsey.bc.ca
Message-ID: <1379@van-bc.wimsey.bc.ca>
Source record: 239268

I reread my included article in your post,and still can't see how
you inferred your conclusion from what I said. I'll try again however.
My point was not that they should give the software away. I purchased
the ICD host adapter and got the software with it. By ICD's policy I have to
download updates from either their board or one of the pay services. AND I
cannot(again by their policy) give a copy to a friend with the host adapter.
As the software only works with the host adapter purchased from ICD, I find
this policy makes little sense and if protection from piracy is the point
it obviously isn't working. Is this clearer. In no way do I support piracy
and I think ICD's distribution policy on their updates is a little extreme.
It is however far better than any other software I've seen for the HD
and I'm very happy with the Hardware to.(non payed endorsment)

I use the brute-force method:

```
#define DEBUG(x) x /* x */

DEBUG(fprintf(stderr,"<<File %s Line %d>>\n",__FILE__,__LINE__));
```

et cetera. You also could use the Sozobon debugger, sdb, available from the Panarthea file server or by FTP from atari.archive.umich.edu. I have not made use of it.

It works just dandy in the production version of PageStream 1.8. Not long ago I printed some PostScript to an MS-DOS disk, stuck the disk into a Mac II with a Superdrive, pulled the PostScript into the Mac, and sent it to a Varityper VT-600 over an Appletalk network.

> 4. What fonts are available and where?

If you're using PostScript, the best way to set things up is to get Soft Logik's "Disk A", which is available from the publisher or from the E. Arthur Brown Co. It provides screen fonts, font metrics files and .PSF files (which tell PageStream not to bother looking for down-loadable fonts) for the standard internal fonts that come with the Apple Laserwriter and similar PS printers. It does *not* provide dot-matrix outline masters for those fonts.

Soft Logik has a dozen or so font disks with downloadable PostScript fonts. The quality varies. Standard faces appear to be fairly decent. I would recommend that you avoid the novelty typefaces.

PageStream downloads fonts by merging them into the output stream. If you tell it that your printer has limited memory, it will include a purge-font command after each usage, then re-send the font if necessary later in the same document.

1253. Re: Need help with ICD Utils

Newsgroup: comp.sys.atari.st
Date: 1990-08-11 18:41:14 UTC
From: dcrevier@jarthur.Claremont.EDU
Message-ID: <8087@jarthur.Claremont.EDU>
Source record: 239273

I think they want to make sure people get clean copies of the host adaptor software. It would be pretty easy to stick some kind of virus in ICDBOOT.SYS that would be practically undetectable. Since you can only download the software from places where they upload it, you can be sure that you are getting a clean copy. If you get it from a friend, you can't be sure. I think that this policy does make sense, but it is hard on the user who has to use a pay system to get a new version.

Dan

1254. Wanted: a decent UUCP for TOS.

What with all the changes that happen at any corporation, and at Atari more than some others, I'd like it if someone at Atari would occasionally post a list of perhaps 20 of the more interesting positions and who holds them. I guess any division president has an 'interesting' position. In this crowd the contact people for user groups and for equipment swaps would certainly be interesting, and the leaders of operating system-related software teams might be interesting. No big deal, but it would help us feel closer to things, and in the case of contact people, it might make the system work a bit better.

From: bill@mwca.UUCP
Message-ID: <1695@mwca.UUCP>
Source record: 239290

I recently grabbed sozobin.arc and sozolib.arc from terminator, but I've
seen bits and pieces that imply there is a bug in one of the library calls.
Can someone let me know what patches/additional libraries I should acquire
to have the latest/greatest Sozobon installation?

Thanks!

Hi!

On a similar note to the above, does anybody know whether an emulator for
a Z80 machine exists for the ST? I thought I heard of a ZX Spectrum emulator
for the Amiga, but I'm not sure if this is true. Also, what about that Z80
cross-compiler - does anyone have a copy of it?

Thanks for any info...

Bye for now,
Dougie.

Source record: 239291

In article <5645@castle.ed.ac.uk> elev35@castle.ed.ac.uk (R C Smith) writes:
>Can anyone tell me what all the .ttp files in gcc do? Any documentation
>would be appreciated.

>cnm.ttp
This prints out the symbol table of a TOS format executable file,
if present. Currently the linker spits out Alcyon format symbol
info. (I kinda wish it used MWC format. Oh well...)
>fixstk.ttp
This lets you change the amount of stack space a program will
allocate. This amount cannot be changed at runtime, so must be
stored as static value in the TOS executable image.
>gcc-cc1.ttp
This is the main compiler driver & code generator & optimizer.
When folx say "gosh, gcc sure uses a ton of memory" this is the
culprit. }-)
>gcc-cpp.ttp
This is the C preprocessor.
>gcc-ld.ttp
This is the linker, which combines gcc format .o files into
TOS format program files. gcc does not use the Alcyon format
for its object files. The gcc format is a slightly modified
Unix .o format.
>gcc-nm.ttp
This prints the symbol table info for a gcc .o object file
or .lib archive file.
>gdb.ttp
This is the GNU debugger, a fairly powerful source-level
debugger.
>printstk.ttp
This prints the current stack size of a gnu-compiled TOS program.
>sym-ld.ttp
This is a modified version of the linker, which creates a symbol
file which is necessary for use with gdb. Since the Alcyon symbol
format isn't flexible enough to include all the necessary debug
info, it gets stored into a separate .sym file.
>toglclr.ttp
This toggles the fast bit for TOS 1.4 files. If the fast bit is
set, the heap is not cleared. If cleared, the heap is zeroed.
(And note, the heap is not the same as the BSS, which is always
zeroed.)
>gcc-as.ttp
This is the gnu assembler, which turns the output of gcc-cc1 into
object code. It's kind of a Unix-format assembler. Strange syntax.

1272. PageStream Demo of v1.8

Newsgroup: comp.sys.atari.st
Date: 1990-08-13 22:48:57 UTC
From: schultzd@frith.uucp
Message-ID: <1990Aug13.224857.10751@msuinfo.cl.msu.edu>
Source record: 239295

I was trying to get the lharced demo of pagestream from
'clotho.acm.rpi.edu', but I ran into some problems. I used binary
mode in ftp to get the file into my unix account. At this point
point, the file was roughly 280K. I used binary mode in kermit to
download it to my ST. I ran into to transmission errors after about
340K(!!!) had been downloaded. Just for the heck of it, I tried to
UNLZH what I did get. (This, of course, blew up in my face.)

Has anyone managed to get PageStream Demo1.8 working? It is too much
to try and mail across the net and download. So, would anyone
consider putting onto a disk that I mail and mailing it back? I've
sent 3.5s through the mail before ($0.25) for one disk.

A very effective tactic I use is try to send your leader as fast as you can
in the computer's territory, then build one maontain by clicking repeatedly
on the same spot... this destroy a lot of its castles, without not much mana.

Moreover, sometimes it wants to fight back and level your land, just elevate
another one, you will be able to out-mana it...

This tactic has allowed me past worlds I tought impossible to win.

1276. Object-Oriented Atari Logo (fuji)

Newsgroup: comp.sys.atari.st
Date: 1990-08-14 13:14:07 UTC
From: daroloso@aftermath.waterloo.edu
Message-ID: <1990Aug14.131407.1649@aftermath.waterloo.edu>
Source record: 239211

Does anyone have an object-oriented Atari logo (the fuji symbol)?
I would like to use it in PageStream for our club newsletter.

The reason I want an object-oriented item is so that it
can be enlarged to the full screen without the lines
becoming jagged since the object is defined by the lines not by the dots.

GEM or EasyDraw objects are usually object-oriented.
IMG, Degas, and Neochrome objects are usually not object-oriented
but instead bit-mapped graphics (defined by the dots).

Thanks,
Dani A. Roloson

#1

I don't think anyone from Atari who reads the net will comply with your
request. It is rather time consuming and the person may not want to
take the fallout when Hacker A starts phoning division heads and asking
dumb questions.

#2

You can get the info you want plus a snoutful of propaganda just by
sending Atari Corp. a note and requesting an annual report. It
makes very entertaining reading.

I just received a pamphlet in the mail from the makers of
Neodesk announcing version 3.0. It has a lot of new features.
The cost is approx. $70. Upgrades from versions 2.0 and up
are between $20 and $25. Upgrades from version 1.0 cost more
($40 I think, can't remember right now). If it help with
your decision, I currently have version 2.3 and I will
DEFINITELY be sending for the upgrade.

I just got my upgrade notice last week. If I remember correctly, the new retail price is going to be $69. The upgrade is just $20 (from version 2.05). It does look very good with lots of really neat improvements.

Only for gcc versions 1.34 and earlier. The gdb that comes with the
Atari ST port of gcc 1.37.1 only supports -gg, and support for this
debug format was dropped in favour of the unix-format -g starting with
gcc 1.35 (so I'm told by jawar r. bammi).

Look for a package called Phasar (v4.0). It should be under $100 and allows
for numerous accounts with upto 500 entries per month per account. Does reports
graphics and other goodies.

Gadgets' connection to the net was unreliable for a couple of months
due to hardware problems with the system that they talk to (tcr). And then
Gadgets changed computers (from a AT&T 7300 to a Japanese 68030 box) which
added even more problems. Things seem to be working fine now. You should

1289. v12INF1: Introduction to comp.binaries.atari.st

Newsgroup: comp.sys.atari.st
Date: 1990-08-15 00:13:11 UTC
From: koreth@panarthea.ebay.sun.com
Message-ID: <2965@male.EBay.Sun.COM>
Source record: 239201
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

Submitted-by: koreth@panarthea.ebay.sun.com (Steven Grimm)
Posting-number: Volume 12, Info 1
Archive-name: intro

This is the first of three introductory articles about comp.binaries.atari.st. This one describes how to submit binaries to the newsgroup. A companion article lists all previously-published binaries, and a third article explains how to retrieve and unpack binaries posted by others.

I am always looking for suggestions on how to improve the usefulness of the newsgroup, and can be contacted as listed below.

-- Steven Grimm
koreth@panarthea.ebay.sun.com

Subject: Submitting binaries for publication

Items intended for posting or queries and problem notes should be sent to atari-binaries@panarthea.ebay.sun.com. If you are on a UUCP-only site, you can send them to {backbone}!sun!ebay!panarthea!atari-binaries.

If you're in Europe, you can send binaries to the European submoderator, Jan-Hinrich Fessel, at unido!atari-binaries (or, if you're a masochist, atari-binaries@unido.informatik.uni-dortmund.de.) He will test them and forward them to me. Submitting to him saves net bandwidth, so it's encouraged.

If you want verification of arrival, so say in a cover note, or at the beginning of your submission, if it is small. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, software without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two separately. If I have to separate your sources from your binaries by hand, your submission will most likely sit on the back burner for a while.

Also, as of volume 8, I will only accept binaries packed with an archiver for which source code is widely available. For the time being, this pretty much means arc, zoo, and lharc. If you want to use a nifty new archiver, make the source code available to the public (posting to comp.sources.atari.st

is fine.) I reserve the right to repack binaries with another archiver if the other archiver saves a significant amount of space, or has other advantages.

If you're submitting a demo of a commercial program, or a shareware program, please keep the amount of advertising to an absolute minimum. The net gods become angry when people try to use the net as a free advertising medium, and I'd like to keep comp.binaries.atari.st out of trouble. If you want to solicit orders, do it in a README file or an About... dialog box, not in a message that comes up every time the user does something. In other words, treat the net like a PBS station (apologies to those outside the US.) I will not accept programs which I feel are excessively commercial. I'm aware that commercial demos and shareware are often very useful (to the users on the net,) which is why I allow them at all.

Subject: The structure of comp.binaries.atari.st articles

Each posting in comp.binaries.atari.st is called an "issue"; there are roughly 100 issues to a volume. The division is arbitrary and may vary. There are two types of articles in comp.binaries.atari.st: binaries and "information postings." They can be distinguished by the subject line:

Subject: v12INF2: Index and other info

This first word in the title identifies this as the third info posting of volume six. Similarly, the subject line shown below:

Subject: v12i081: deadwrtr -- Ouija-word processor

identifies this as the 81st binary article in Volume 12. Large programs are broken up into smaller pieces, and have subject lines that look like this:

Subject: v12i041: zx81 -- Timex/Sinclair emulator part04/39

Certain information about the system configuration required to use the program is given on the keywords line.

Keywords: uuencode, 1meg, medium, high

This means that the program requires at least one meg of RAM and runs in medium or high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

uuencode - program is uuencoded (UNIX uudecode required to unpack)
uue - program is uuencoded (ST uud required to unpack)
arc - program is archived (arc required to unpack)
zoo - program is a zoo archive (zoo required to unpack)
lharc - program is an lharc archive (lharc required to unpack)
high - high resolution
medium - medium resolution
low - low resolution

1meg - needs 1 meg of RAM

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: jackt@atari.UUCP (Jack Tramiel)
Posting-number: Volume 12, Issue 80
Archive-name: rsn

The "Submitted by" is the author of the program. If you have comments about the binaries published in comp.binaries.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The "Reply-To:" header line in the article's main header points to the submitter, to make commenting about binaries easier.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this program in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

Since most archive sites run UNIX, articles are given UNIX-style filenames rather than ST-style filenames. I do make an effort to keep filenames to 8 characters or smaller, however.

Subject: Reporting and tracking bugs and patches to postings

Updates to programs are usually announced in comp.sys.atari.st. When large changes are made to a program, the entire thing will be reposted to comp.binaries.atari.st.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the programs I moderate, so don't send your bug reports to me.

If the program documentation mentions some file that isn't included in the posting (for instance, a font editor's documentation might refer to some sample fonts), contact the submitter, not me. I post articles in their entirety, so if it isn't posted, I probably don't have it.

1290. v12INF2: Index of previously-published binaries

Newsgroup: comp.sys.atari.st
Date: 1990-08-15 00:14:19 UTC
From: koreth@panarthea.ebay.sun.com
Message-ID: <2966@male.EBay.Sun.COM>
Source record: 239202
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

HOW TO USE COMP.BINARIES.ATARI.ST

by Steven Grimm

Last update: August 3, 1990

A preliminary note, for those of you who know most of the
below already: the official archives on panarthea are NOT
reachable via anonymous ftp from the Internet. Read on for
information about accessing them by mail, or see the table
at the end of this document for a list of alternate archive
sites.

_1. _W_h_a_t _a_r_e _b_i_n_a_r_i_e_s?

Binaries are files that contain information other than
normal text. Usually, a binary that is posted to the net
will contain executable (program) files. Binaries are dis-
tinct from _s_o_u_r_c_e_s, which are the human-readable text files
that are interpreted by a computer and used to produce
binaries. Sources can be modified with relatively little
effort, and are usually pretty easy to read. Binaries are
not intended to be viewed by a human.

_1._1. _U_u_e_n_c_o_d_i_n_g

The programs which transfer network news messages (and
electronic mail) are not always capable of handling a pure
binary file. They are designed to handle textual messages,
and the odd symbols and characters in a binary cause them to
become confused, and often to mangle the binaries. To avoid
this problem, a method called _u_u_e_n_c_o_d_i_n_g is used. Uuencod-
ing translates a binary file into text characters, so that
the news and mail transport programs won't mess up. The
disadvantages are that uuencoded files are about 30% bigger
than the raw binary files they represent, and that you have
to go through one extra step to get the binaries to work on
your computer.

_1._2. _A_r_c_h_i_v_e_s _o_r "_a_r_c _f_i_l_e_s"

Usually, a program will need more than one file to work properly. The extra files might be data files, help files, or maybe some instructions for the user. In order to easily package multiple files together in one binary file, a program called "arc" (short for "archiver") is used. Arc also compresses all the files as it packages them, so that the arcfile take up less disk space (and takes less time to download!) than it would if its contents were just thrown

together.

To confuse matters even more, two new archive programs called "zoo" and "lharc" can also be used to achieve the same effect. Zoo is superior to arc in some respects, slightly inferior in others, as is lharc. Unfortunately, you can't unpack a zoo archive with arc or lharc, or vice versa (arc and lharc are similarly incompatible with each other.)

_1._3. _U_S_E_N_E_T _a_r_t_i_c_l_e_s

The USENET has groups designed especially for transmission of binary files. They are usually called something like "comp.binaries.x," where x is the type of machine that the programs will run on. For Atari ST owners, the group to watch is comp.binaries.atari.st. Most of the binaries groups (including the Atari binaries group) are _m_o_d_e_r_a_t_e_d, which means that you can't send a program directly to everyone on the network. Instead, you send it to someone in charge of the group (the _m_o_d_e_r_a_t_o_r), who makes sure that your program works and contains the proper documentation (or that the lack of documentation is announced), and that it's in the correct format to be sent out to the rest of the USENET.

One of the restrictions of the USENET is that articles can only be a certain length. If a binary is longer than that, it must be split up into several parts, each no longer than 45000 bytes or so. This introduces yet another obstacle to people who want to transform the articles into a useful form, but it can't really be helped until the USENET starts running much more advanced news transmission software. Also, some particularly long programs may be posted over the course of several days; otherwise the net would be overloaded with lots of huge messages, and people would complain.

USENET binaries are grouped into _v_o_l_u_m_e_s, each containing about 100 articles. This is to make life easier for people who are trying to keep track of which articles have been posted. When a new volume is started, the moderator

will usually post introductory articles, including a list of previously published articles.

_2. _H_o_w _d_o _I _g_e_t _b_i_n_a_r_i_e_s?

There are two ways to get binaries: first, by reading the USENET newsgroup comp.binaries.atari.st; you will see new articles within a week (usually much less) of the time they were sent out by the moderator. If, for some reason, your site doesn't receive comp.binaries.atari.st, or if you want to look through previously posted articles, site panarthea.ebay.sun.com has all the binaries stored in its

archives.

The other way to get binaries is to request them from panarthea's archive server. The archive server is a program that intercepts incoming mail messages and looks for commands inside them. You can tell it to list the available binaries, give you help, or send whichever files you're interested in. The requested files will be mailed to you. One thing to be careful of is that multi-part postings aren't placed in the archives until all their parts have been sent out to the USENET at large. This is to prevent people from requesting all 99 parts of a program the first day it appears, thus overloading the net and defeating the purpose of piece-by-piece posting.

To find out more about the archive server, send a mail message containing the word "help" to archive-server@panarthea.ebay.sun.com. Talk to an administrator at your site if that mail address doesn't work. If you don't get any response from the archive server within a few days, something may be wrong; mail archive-manager@panarthea.ebay.sun.com to report the problem.

There are other archive sites, too, such as terminator.cc.umich.edu; they contain most of the comp.binaries.atari.st software as well as some additional programs that have not appeared on the newsgroup. Some sites, such as terminator, also offer something called "anonymous ftp" if you're on the Internet. Say "ftp terminator.cc.umich.edu", and if you connect, use "anonymous" for a username, and your username for a password. See the ftp documentation at your site for more information. A recent, but possibly incorrect, list of alternate archive sites appears at the end of this article. Please send me mail if you know of any that aren't mentioned here, or if my list is incorrect. Note that panarthea does not offer anonymous ftp, as it's on a network that's segre-

gated from the Internet.

Panarthea also offers an "auto-index" service, for people who don't have access to the USENET groups. If you request autoindex service, you will receive copies of the archive-server's index files for the binaries and sources groups whenever new files are added. Note that if your site gets comp.binaries.atari.st, requesting autoindex is pointless and a waste of net bandwidth. Send mail to autoindex-request@panarthea.ebay.sun.com if you'd like to sign up.

_3. _H_o_w _d_o _I _d_e_c_o_d_e _t_h_e _b_i_n_a_r_i_e_s?

As stated above, turning binaries from USENET articles into a more useful form can be a multi-step process. At the least, you will need the uudecode program; it is standard software on most UNIX|- systems and is available in a couple

---
|- UNIX is a trademark of Bell Laboratories.

of forms on the Atari. Versions for other operating systems do exist, and can certainly be written with little effort. Arc is available for UNIX and other operating systems, but is not standard software. In any case, you will want at least arc on your Atari.

A version of uudecode written in ST BASIC is available in panarthea's archives (see above). It is in volume 1 of the comp.sources.atari.st directory (note that that's _s_o_u_r_c_e_s and not binaries). Once you have that, you should get the files "arc," "arcdoc," and "uucode" from volume 1 of the binaries directory. They contain the arc program mentioned earlier, its documentation, and a much better, faster version of the uudecode program.

Use the BASIC program to uudecode the two encoded files; then use arc to unpack the better version of uudecode. (Arc is documented in "arcdoc.") Note that if you're reading news/receiving mail on a computer (such as a UNIX system) that already has uudecode, you can skip most of this; you will probably just want to uudecode arc there, then download it (using kermit, xmodem, or your favorite transfer protocol - consult your site's administrator and your Atari communication package's documentation for more information. Remember to use binary mode when downloading arc files!)

So far, everything has been small enough to fit in one piece, but you will almost certainly want to try something larger eventually. The Atari "uud" program (whose source code, also suitable for compilation on UNIX systems, is

available in the sources archive) is capable of easily decoding multi-part uuencoded files. Near the top of each part (except the first) will be a line like

begin part c foobar.uac

Rename each file (except part 1, which can be named "part01" or just about anything else) to the name at the end of this "begin" line, in this case "foobar.uac". Then run uud on the file containing part 1; it contains instructions to cause uud to look for the other parts. If you have a text editor or a UNIX style cat program, you can just stick all the parts together in order and run uud on the resulting (big) file; it will try to go on in the first file if it can't find the next part in a separate file. Note that uud won't warn you if it's overwriting an existing file, so don't give any of the parts the same name as the file that's being extracted from them!

On UNIX systems, you can also say (for instance) "cat part* | uud -" without renaming anything.

Using Binaries -5-

If you don't have uud or would prefer to decode your binaries on your larger news computer, the procedure is somewhat more complex. Plain vanilla uudecode doesn't know about multi-part uuencoded files, so you have to fool it into thinking that everything is in one part. First, stick all the parts together (using cat on UNIX). Edit the resulting file. Now remove all the extraneous lines of text in between the parts -- this includes mail headers, any text, lines of the form "include foobar.uad," "table" lines and the lists of characters following them, and "begin" lines other than the one at the beginning of part 1. Once you have converted all the parts into a big uuencoded mass (with no blank lines!), the regular uudecode program will work.

Obviously, this is something of a hassle, and the recommended procedure is to try to install uud on your large computer. You'll usually want to minimize the amount of data you have to send to your Atari, since you'll most likely be downloading it at a relatively low speed, and the uudecoded .arc file is the smallest thing you can download.

Zoo is available from the archives. It is simple to use; refer to the documentation included in zoobin.arc (yes, you need to use arc to extract zoo!) for more information. The uudecoding process is the same for zoo and arc files. Lharc is also available.

Most archives contain documentation; refer to the
instructions in a specific program for usage information and
the like. If you have problems with a particular program,
send mail to the submitter (listed near the top of each
part.) The moderator doesn't have time to become very fami-
liar with all the programs that are posted, so the submitter
will probably be much more helpful.

_4. _L_i_s_t _o_f _a_r_c_h_i_v_e _s_i_t_e_s

Note: I have not verified these, so this list may be
wrong. Mail servers usually respond to the word "help"
alone in a mail message. Some of the sites listed below may
not contain full archives of comp.binaries.atari.st, and
some may have other files.

1292. Monitor question

Newsgroup: comp.sys.atari.st
Date: 1990-08-15 00:23:00 UTC
From: roger@tippy
Message-ID: <1990Aug15.002221.13889@tippy>
Source record: 239204

Service Merchandise has the Packard Bell Paper-white VGA monitor on sale for $120. I was thinking about replacing my SM124 monitor with this. (It offers higher resolution than the Atari monitor.)
Has anyone tried this? Can some of you techies out there tell me if it will work?
Thanks in advance - roger

1296. ST disks on a PC - are they readable/writeable ?

Newsgroup: comp.sys.atari.st
Date: 1990-08-15 13:23:20 UTC
From: iiitih@cybaswan.UUCP
Message-ID: <1946@cybaswan.UUCP>
Source record: 239214

I have recently purchased an STe and I was wondering whether
there was any truth in the fact that floppy disks formatted
on an IBM PC are read/writeable by the ST and visa versa.

If so, is there anything special which needs to be done - eg. does
one need to format in a special way on the PC?

Any information would be most welcome!

Thanks in advance...

Ivan

In article <6750.26c841d4@umiami.miami.edu>, dnd15j9z@umiami.miami.edu (Frank Rachel) writes...
>I need to know if an Atari SH204 20 meg hard drive can be upgraded by
>means of putting in another drive.. Like 'popping' out the 20 meg and

Yes, this is an easy upgrade. Make sure that the power supply can handle the requirements of the new drive (all of the SH204 supplies I've seen have the current rating stamped on them), then pull out the old drive and put in the new. If the new drive is an embeded SCSI drive then remove the 40 pin ribbon cable from the controller (or remove the whole controler) in the SH204 (the large board that sat above the drive) and connect the 40 pin cable directly from the host adapter (the small board above the power supply) directly to the SCSI drive.

You can put in either a 3 1/2" or 5 1/4" drive.

Disks formatted on a PC are writable and readable on a ST. TOS >=1.4 formats
disks in a format acceptable to a PC. As far as I know, the older TOSes have some
quirk which does not exactly format disks to PC standards. There are PD
formatters you can use to get PC formats using old TOS versions. TOS 1.6
(on STe) should format PC compatible disks.

Correct me if I am wrong...

While the monitor may be have a greater resolution, the ST isn't going to take advantage of it. (Unless you modify your ST with something like Overscan or Hyperscreen, etc.)

In my opinion, the only reason to get a non-Atari monitor is if you're going to get a multisync, so you can display all 3 modes on one monitor. And the only reason to get a really slick multisync is if you've got some kind of enhanced video that will take advantage of the better resolution. Otherwise forget it, you're wasting your $$$.

(For example - don't expect wonderful things from an unmodified ST in high-rez on a multisync. It'll probably look plenty sharp, but the image will appear to be about the same size as a Mac screen. Yikes! Maybe things are different if your multisync has auto-center & auto-scaling, I don't know. I just know that the only reason it's worthwhile for me is because I use the overscan mode.)

1312. Where has Aerco gone?

Newsgroup: comp.sys.atari.st
Date: 1990-08-16 20:55:18 UTC
From: ric@mcrware.UUCP
Message-ID: <2477@mcrware.UUCP>
Source record: 239232

Netlanders:

I have an Aerco board installed in my "old" 520 ST (no FM). It has
512K on it (in 16 256K chips).
I would like to go to 2.5 Meg, but I can't get ahold of Aerco to ask
whether or not board modifications are necessary. Can someone tell me
if Aerco still exists or, better yet, what do I need to do to accomplish
this upgrade (there's a row of sockets with chips in them and a row
without)? Can I go to 4 Meg? Please E-Mail, if possible, and I can post
the result if anyone is interested.

Thanks in advance,
Ric Yeates

PS I would look at the documentation, if I could find it!?!

Well, I juggle PC disks back and forth between school and my Mega all the time.
I have found best results with a program called ps2form from terminator. It
is a little tos program that formats disks to make them usable on IBM pc com-
patables (including the PS/2's, which apparently have some disk quirks). I
have never had a problem with them. Oh, if your disks stop working for no
reason (ie as soon as you use them on your ST the pc compatibles no longer
recognize them) suspect a virus!!! That is how I found out about mine.
Vkiller 3.something is available from terminator also, and is excellent.

You may have a hard time running this monitor at 70Hz, which is needed to perfectly emulate a SM124. You can use a multi-sync monitor, with an appropriate interface. If you figure out a way to use a regular VGA monitor with an ST, please post it!!

I asked someone from Atari Germany about that and he told me that the TOS reads the partitioning of a hard disk *once* upon startup and puts it into a certain data structure. (I don't have the name at hand - was it BPB?) This is of course sufficient for "normal" hard drives which don't change their partitioning on the fly.

There has been talk that with the Megafile 44 one can not swap disks with different size partitions without a reboot.

I do not know if this is true, nor do I know the solution...

I can tell you this, I have a SyQuest mechanism connected to my ST with an ICD Advantage Plus host adapter. With the ICD BOOT software I am able to swap disks with different partition sizes... no problem.

If you can not find another solution to your problem, and really need this capability, I suggest buying the ICD Adv+. It is around $100 and comes with a battery backed clock & software to get/change time (use it in the Auto folder). There are also a bunch of neat utilities included.

I have no offiliation with ICD, except that I am a satisfied customer.

I cannot get gcc-cpp.ttp to run correctly under Micro-RTX. Under Gulam (TOS), I can type

gcc-cpp hello.c hello.i

and the pre-processed output goes to hello.i. Under RTX, however, I get an error (cannot create output file). This is a problem, since gcc uses temporary files for its passes. Can anyone help? I have the sources to gcc 1.37 from Terminator, but I have no idea on earth how to extract gcc-cpp from that mess to compile it on my ST.

By the way, does gdb work with gcc 1.37? I remember seeing a message claiming that it did not, but it was a little confusing. Thanks.

[...]
>By the way, does gdb work with gcc 1.37? I remember seeing a message
>claiming that it did not, but it was a little confusing. Thanks.

Yes! GDB works fine with gcc 1.37.1 (I got mine from dsrgsun.ces.cwru.edu [129.22.16.2]). It is a little confusing at first, though. Basically, you have to go through these steps...

1) Write your c source (the easy part <heh>).
2) Use the -gg switch when compiling and make sure the pre-processor symbol __NO_INLINE__ is defined (either in source or on command line):
gcc -c -gg -D__NO_INLINE__ file.c
(Hmm, maybe I/someone could put the NO_INLINE bit as default for -gg in gcc)
3) After you link, you need to make a special symbol file with sym-ld. Use the -r switch, and specify the modules in the same order (I think). For that reason, I like to link explicitly, and not trust gcc to do it:
gnu-ld -o a.out \lib\gcrt0.o file1.o file2.o -lgnugdb
sym-ld -r -o a.sym \lib\gcrt0.o file1.o file2.o -lgnugdb
You can use the "gnugdb" libs if you have them, but the plain "gnu" works too (sometimes you can get lost in the libs, and library calls with invalid parms are hard to de-code). Of course, use gnu16 if you're a -mshort person. Okay, now for the fun part.
4) Invoke GDB without arguments.
5) Load the executable and symbol files:
exec a.out
sym a.sym
6) Start the program, setting args if appropriate
set-a argv1 argv2
run
7) GDB will automatically stop at the top of your program, so set yer break points and squish some bugs!

We should all give our deepest appreciation to the folks who made GDB work, by all accounts it was a massive ugly hairy beast from the depths. So THANK-YOU jrd (and John Dunning for a sweet debugger, too)!

> server.

No, the vice versa is true.
The SERVER run the program
The CLIENT is just the DISPLAY.

1338. printing graphics (C) - ignore if irritated by beginners questions

Newsgroup: comp.sys.atari.st
Date: 1990-08-20 12:47:29 UTC
From: jbe@sws4.pcs.com
Message-ID: <802@pcsbst.pcs.com>
Source record: 239158

This is a simple question for hackers, but it's the first time I'm
trying to do this and don't want to waste a lot of time trying it out.

I'm writing a program in C using AES and VDI calls. The prog produces
graphics. I need to take a part of this (a box with contents) and send
it to a printer (EPSON), to specific xy-coords. I have a monochrome monitor.

Can anyone send me some tips (a piece of code??) on the best way to do this.
I havn't found a function which dumps a section of the screen to printer.

I assume I have to do the following:

1. switch printer to graphics mode

2. query which pixels are set and which aren't

3. send the info pixel-wise to the printer

4. switch the printer back

This seems a long and tedious way to do this.

Thanks a lot.

1339. GNUPLOT for the ST anyone ?

Newsgroup: comp.sys.atari.st
Date: 1990-08-20 12:54:50 UTC
From: jensting@skinfaxe.diku.dk
Message-ID: <1990Aug20.125450.16511@diku.dk>
Source record: 239159

Has anyone ported GNUPLOT to the ST? I note from the source (for GNUPLOT v2) that the graphics are really nicely isolated, i.e. an addition of GEM VDI should be very painless. One could also try to integrate full GDOS (there might not be too much of a difference, I don't know the nitty-gritty details yet..), and do away with a lot of the GNUPLOT drivers for printers.

My own angle would be to try to compile the whole kit and kaboodle with GCC (with 32 bit ints), with Makefile set up as for UN*X, and see how much did and how much didn't work.. . I don't want to start from scratch if someone else is doing the same job (and wants to share).

TIPS AND HINTS from other users

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, and STacy.
There are also emulators for the Apple Macintosh and IBM XT available.
Finally, there is the Lynx (a game machine) and the Atari TT and ATW.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st
comp.sys.atari.st.tech
comp.sources.atari.st

What sort of articles would interest people reading comp.sys.atari.st?
======================================================================

The most interesting articles are technical articles, impressions of
software/hardware, information on Atari user-groups and shows, or helpful
hints on how to make better use of the machine and its software.

The least interesting articles are in the form of 'my computer is better
than...', especially when cross-posted outside of comp.sys.atari.st. If
```

you don't know how to eliminate other newsgroups from a reply to an article which is cross-posted, ask your systems administrator.

'FOR-SALE' articles should be posted to misc.forsale, and ONLY local distribution of comp.sys.atari.st. Those outside the United States have little desire to read about that neat bit of [hard/soft]ware you're selling when you live in the U.S.A. If you don't know how to restrict distribution of a posting, ask your systems administrator.

Many articles are in the form of "How do I...?" or "Where do I...?" In this article, I will try to answer some of the most-often asked questions.

Where can I get Public Domain/Shareware software?
==========

There is an FTP source and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

For anonymous FTP: atari.archive.umich.edu [35.1.33.8]

User anonymous
<enter password>
cd /atari

The atari.archive server is now available via e-mail as well. To find out more about bart (the mail server), send a message to atari@atari.archive.umich.edu with a body of "help". You will get a message back with the help file.

For anonymous FTP: dsrgsun.ces.cwru.edu [129.22.16.2]

User anonymous
<enter password>
cd pub/atari

The dsrgsun server gave me the following message when accessed today [20 July]:

pub/atari contains atariST Tos files
pub/minix contains atariST Minix files
pub/Composers is the Prolog Composers archive
pub/plink is the Prolog "lint" checker
pub/promix is the Prolog MetaInterpreter
NEW: (updated Apr 9, 90) in pub/atari:
gcc V 1.37.1 for Tos
PatchLevel 56 of the gcc-tos library
microRtx bindings for gcc
updates for all utilities in util.zoo
emacs V18.55 for Tos. New version
gprof and profiling support for gcc tos
V1 of GnuSmalltalk for TOS - 4M machine req
NEW: pub/atari/UPDATES contains diffs for updating the tos library.

Most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

For the panarthea mail server, see Steven Grimm's monthly posting.
Panarthea holds all of the comp.sources.atari.st/comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so.

How do I deal with Archived files (.ZOO, .ARC, .LZH)?

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are
binary files which may contain one or more other files in a compressed format.
Archive files usually take up less disk space, and for this reason have
become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive
program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

These programs are all available via FTP from the atari.archive server, in the
/atari/archivers directory. Recommended files are:

arc.ttp - needed to extract the other archivers, once.
arc_602.arc - latest version of ARC, with the most fancy features
and quite a lot of documentation
lharc.arc
zoo_bin.arc

There are also several GEM programs which act as 'shells' for the archive
programs. The most popular are Shareware offerings, also available on
atari.archive server in the /atari/archivers directory. They are:

arcgsh21.arc - European in origin
arcsh197.arc - US in origin

The GEM shells are recommended for inexperienced users (and appear to be quite
handy for the experienced user as well!) They require a copy of the archive
program -- in other words you need BOTH the GEM shell *AND* the archive
program in order to use the GEM shell.

Documentation on the use of the archive programs should accompany the archive
files mentioned above. To use ARC.TTP in order to extract these files, use the
command line:

xh xxxx.ARC *.*

where 'xxxx' is replaced by 'arc_602', 'zoo_bin', etc. For example

xh arc_602.arc *.*

will place all files within the arc_602.arc into the current directory. It
assumes you've clicked on the ARC.TTP program from the Desktop and have the
parameter dialogue box on your screen.

In many cases, simply typing a '?h' will provide an extensive list of available options.

Source and binary code for archive programs have also been posted to comp.sources.atari.st and comp.binaries.atari.st. They are available via e-mail through the panarthea archive server. See Steven Grimm's posting for more information on how to obtain files from panarthea.

What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

Below is a letter, originally written by Darryl May,
that John Townsend of Atari posted on GEnie in January to provide some answers. This letter also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170).

Dear ATARI customer,

The following is an official list of the errors that can appear while you are operating your ST computer. This first list gives you the GEM error messages:

Error description GEM Error code
==========

What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett.
The file is on the atari.archive server under /atari/graphics/picfmts.doc.

What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of
STart, volume 1 number 1 said...)

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and more)" by Douglas N. Wheeler from the atari.archive server. The file is /atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server. The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files or font files (at least those supplied by Atari). You can get these files with many commercial programs, such as Degas Elite, WordUp!, etc. You might also want to check your local user group to see if they received a copy of the WordFlair demo program (also available on GEnie). The demo program appears to have the GDOS system and font files.

Is TeX/LaTeX available on the Atari ST?
==========

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the atari.archive server under /atari/tex, or the dsrgsun server under pub/atari/StTeX. Fonts and device drivers (including one for the Epson 9-pin printers) are available on the atari.archive server.

Public Domain/Shareware languages...
==========

Check the atari.archive server under /atari/languages. Currently included:

abc recently posted to comp.binaries.atari.st
apl demo version
forth Don't know which one. I recommend Bradley FORTH
icon
modula-2 From Germany
Sozobon C Most excellant
Elan
xlisp
xprolog
xscheme

You can also get the GNU C program, which runs on 1 megabyte Atari ST systems. For more than minor programming, you may need to upgrade to 2 or more megabytes, as the GNU programs generally assume you've got plenty memory.

Is GNU C available on the Atari ST?
==========

GNU C for TOS is available via anonymous FTP on dsrgsun.ces.cwru.edu [129.22.16.2] in the pub/atari directory. Be sure to check the README file before going further.

Version 1 of GNUSmalltalk is also available on dsrgsun.ces.cwru.edu. It requires a minimum of 4 megabytes of memory. It is also in the pub/atari directory.

Where can I get copies of ZNET?
==========

ZNET on-line magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

ZNET and some information from the Current Notes user magazine are also available from the atari.archive server under /atari/magazines.

ST Pen Pals list
==========

Simon Chappell is compiling a list of people interested in exchanging paper-based mail "of interested parties who could then keep in touch and prevent themselves losing touch with the ST community at large (this would be especially easy if someone who still had net access could summarise current topics or forward news and advice!)"

He is accepting entries in this format:

eg Simon Chappell.
s61304@uk.ac.psw.pa (NOTE: NO LONGER VALID ADDRESS...)
51 Amherst Road, Penny-Come-Quick, Plymouth, Devon, PL3 4HJ. UK.
C, operating systems (UNIX, VMS) & relational databases.

Contact Simon at his paper mail address if you are interested.

TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

==========

I would like to thank those who sent messages with suggestions and comments. I would appreciate feedback, comments, suggestions for more TIPS AND HINTS, etc. E-mail can reach me at the following:

1342. First Word +

Newsgroup: comp.sys.atari.st
Date: 1990-08-20 15:49:18 UTC
From: srs@oasis.icl.stc.co.uk
Message-ID: <1500@ozz.oasis.icl.stc.co.uk>
Source record: 239157
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi there Netters!

Just a quicky about First Word + ,
Is it possible to have it running fom a ram disk?
I've tried a few times, but it keeps looking for the RSC file on drive A.
Tried everything I can think of,can't seem to make it look at my ram disk.
Any help would be much appreciated.

Relpy by email please, the news is slow getting here.

Thanks Alot

Steve

I noticed in your article that you don't think that an X server on the ST would work over a modem. Why not? Have you seen the X-terminals that are widely available? They use a Sun4 as the host, and they have optimized the transmission lines.

If you look at the MIT distribution of X11, you'd see that it is based on a small set of primitives. These primitives are basically rasterops. Sunview is designed on the same set of primitives. However, it is designed to run on Un*x, so it can simple check that the device supports PIXRECT primitives. If so, you can run Sunview on it. I think that a very similiar approach could be used for X11.

Create a version of X11 that runs on Suns using PIXRECT primitives. Then, one would have to write a transmission layer for the modem. I have several ideas on this. The simplest is to transmit the rasterop codes over the modem. A more complex (but faster?) method may be to use an aggressive screen update algorithm for rasterops, like what emacs does with text.

Don't get me wrong, I don't think this would be fast, but I think it would work. The X-terminals certainly work.

1344. Re: Hard Drives with Removable Media

Newsgroup: comp.sys.atari.st
Date: 1990-08-20 16:53:21 UTC
From: rughoeft@fokus.berlin.gmd.dbp.de
Message-ID: <hug.651171201@uranus>
Source record: 239165

Hi out there !

I'm posting this to 'world' even if i mention a german product, because
i think there are connections for getting german stuff at least by
mail-order even from "outer space" :-).

[longish text follows, so nothing quoted]
hit 'n' NOW, if you are satisfied with yout HD driver

I use the HD driver CBHD of Claus Brod which comes with the
"SCHEIBENKLEISTER II", a pretty good (german written) book about many
flavour of storage media.
The main aspect of the book are floppy disks, harddisks and their
management under TOS, but there are also chapters about tape drives and
cd-roms.
On the disk contained in the book, which costs 79,-DM (~30 $), you find
not only the HD driver but also a _MIGHTY_ sector editor (Floppy and HD!),
a track editor (Floppy only :-), format utilities, copy protection code,
HD benchmarks et caetera.
But first there are CBHD and CBHDINST.ACC !
CBHD serves at most 7 Controllers with each two drives (standard SH20X,
MF30/60), or up to 7 real SCSI drives at hostadapters.
I have two SCSI drives (Syquest and FUJITSU MF2613 130 MB) in the MF44-case,
but I had to replace the ATARI SCSI hostadapter of the MF44 because of
problems with timing and reset conditions between hostadpater and FUJITSU.
Therefor i used a "GE-SOFT III" hostadapter of, you guessed it :-) the
german company GE-SOFT.
When you remove a cartridge, and insert a new one, CBHD drops it's info
and forces GEMDOS to do so as well.
The result is, that the next HD access reads in the information for BOTH
HD's. The only inconvenience (i think it is a bug and no feature) is,
that for each partition you access CBHD reads the info again until you
have accessed all available partitions.
So it can be done !
BTW: CBHD's first version was a rework/reimplementatin of AHDI 1.X.

CBHD offers you until now only a partitioning scheme (14 partition each HD)
similiar to SUPRA. Since Claus just makes his diploma he has had no time
to officially add HDX 3.X extended partions :-(. (Good Luck ! :-)
The accessory lets you write protect partitions, select where CBHD should
load AUTO, ACC and DESKTOP.INF from, extend GEMDOS-buffers, map out
partitions, ship, view HD statistic and force a media change.
While i have still MINIX 1.1 with three partitions hd2-hd4 on the HD, so
up to now i couldn't use HDX 3.X scheme.

Ok, enough for today, my news-quota is already exceeded :-)

Ciao, HuGo

I'm not affiliated with Claus Brod,
just a satisfied user of Book and Software.

1345. Internal drive whirrs when external in use

Newsgroup: comp.sys.atari.st
Date: 1990-08-20 17:08:07 UTC
From: tkld@castle.ed.ac.uk
Message-ID: <5824@castle.ed.ac.uk>
Source record: 239164

I've just got myself an external drive for my 1040STFM (a Kempston Daatadisk - dunno what mechanism is inside the case - but it''s small, fast and does 90 tracks :-) I wasn't impressed with Kempston's new marketing arm "Pandaal Marketing" though - it took them nearly 2 months to send me the drive)

The problem (is it, maybe it isn't, but it's annoying) is that every time I use drive b: , my internal drive a: starts spinning (but the light doesn't come on). The only cure seems to be removing any disk from drive a:
There is no problem reading data, but my internal drive is *so much louder* than the new drive.

Is this common ? Is it software, hardware, me ? Can it be fixed ?

The original poster (Roberto?) is correct. Under the X Window system,
the X Server receives requests (drawing primitives, event-notification, etc.)
from X clients. Based on these requests, it handles the device-dependent
aspect of the X window system (drawing to the physical screen(s), accepting
inputs from mice, keyboards,etc.). Clients, on the other hand, receive events
from the server notifying them when they should repaint their window(s),
when the user hit the keyboard, moved or clicked on the mouse, etc.

Hm. The only X-terminal I have seen to work reasonably well over serial
lines were those from GraphOn. I believe they used some data compression
techniques to get their results.
Most X-terminals work because they're connected to hosts via a high-bandwidth
Ethernet. Those X-terminals supporting SLIP (serial-line IP) don't seem
to run reasonably fast over regular phone lines (ie. 1200-19200bps),
especially when you have multiple clients running.

> Eric
> ericco@ssl.berkeley.edu

There are several ways of optimizing the transmission of primitives over
slow media. They all have the same "side-effect": they eliminate X
Window's greatest plus (in my opinion) - being able to run _any_ remote X
client on a network on your local X Server. Once you start optimizing (ie.
coming up with your own transmission layer, using non-standard/compressed
events, etc.), you're tied to a single host and/or single set of clients
which "speak" this language.

Mind you, I'm not trying to discourage you from writing an API that is
Xlib compatible and works great over serial lines...I have a Sun at work
and an ST at home and could make use of such a beast :-)

Tom

If that is the case, `screen' is pretty useless. This functionality is already built into csh (look up the %, fg and bg commands). A program like screen would be useful on something dumb like SysV, but it's a no-op on BSD.

1355. Atari 1027 printer on an ST?

Newsgroup: comp.sys.atari.st
Date: 1990-08-21 03:18:53 UTC
From: John.Bunch@samba.acs.unc.edu
Message-ID: <877@beguine.UUCP>
Source record: 239173
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello all,

I just recently was given an atari 1027 printer, and would like to know if it is possible to hook the beast to my ST? I realize that it may require building some sort of adapter so the st can talk to the SIO port on the printer. Has anyone ever attempted such a thing? Is it possible to do? And If you not sure, do you know where I may be able to get the manual for the printer? It was given to me without a manual and without a power supply...

John Bunch

>send me the going price for MT-Csh. If it's close to what I
>remember I still can't afford it...oh well.

In fact, I have been working on this very thing. The only thing I'm stumbling over right now is implementing a good signal() suite. Pipes and background jobs are a piece of cake, RTX is really good for this sort of stuff. (I have another problem, regarding fork, but I think I have a workaround now...)

Also, allowing pipes or background jobs doesn't depend on the filename extension. Many .prg's seem to be meant to be run from a CLI. The shell will set up descriptors 0, 1, & 2 as specified by the command line, and then it's up to the run-time startup code in the executable file whether or not to pay attention to any of it.

One other problem is that once you have this sort of shell running, you really need the equivalent of the ps command to help keep track of what's going on in your system. I'm still trying to figure this out, probably going to try using the same scheme that MT-Csh uses. (Which I suppose is the best solution anyway, since that will provide compatibility with a few other MT-C tools as well.) But that leaves me with duplicating David Beckemeyer's efforts, since he's already written a perfectly good ps program in his MT-C package. Doesn't seem all that worthwhile. Sigh.

It's all well and good to bring up GNU utilities on a running Unix system, but trying to add them a piece at a time to the ST shows you just how much is lacking in the ST's OS. Getting a good environment set up takes a lot of groundwork, even given a good kernel (such as Micro-RTX).

Actually, in most cases I think screen is much more useful than uw. You get the equivalent of an unlimited number of virtual CRTs. The program uses curses to update the physical screen, and each task gets its own virtual screen. Jobs running in hidden screens have their output buffered until you select the appropriate screen. Unlike job control in the C shell, which lets you spawn off multiple jobs from a single control terminal, all demanding their input and spewing their output all over your CRT, screen lets you spawn off shells, tip, telnet, or whatever program you want, each with its own pseudo-tty as a control terminal. It's an incredibly useful and flexible program. One feature I love is that you can detach a session, and reattach it a later time *from anywhere else*. I can dial up from home, start up screen, telnet to various places, start up long ftp sessions, etc., then detach and logout. Then I can hang up, do other work, go to my office, whatever, and login to the screen host and reattach the sessions. Once you've used this feature you'll wonder how you ever lived without it. (Especially since this is a common feature of VMS...)

Since uw multiplexes all window output over the serial line simultaneously, having lots of active windows will slow down performance on the current window, and a particularly chatty session can grind everything else to a halt. With screen, everything goes to its own screen buffer, and physical screen updating always occurs at full speed. Hit a hot key to flip to another window, and whatever needs to be redrawn is drawn, and you're there. Very nice. Also, uw only provides adm-3 emulation, screen provides full ANSI X3.64 (vt100) emulation. (Using termcap - it'll take advantage of nearly any feature you can list in your physical terminal's termcap entry.)

[Are you convinced yet?]

It goes far beyond the job control of the C shell...

Of course X will work over a modem. There's the SLIP package allowing it to
do so. The problem is whether *you* will be able to work with it. Users
expect reasonable response times today.

>No, the vice versa is true.
>The SERVER run the program
>The CLIENT is just the DISPLAY.

I have to correct myself. I was told the X Manual stated the opposite.
So Steven Grimm was correct.

Anyway this name convention isn't intuive.
In general a server offers a service. A client uses this services.
(Think in fileservers, diskless cluster, ..)
X Manual thinks SERVER as offering a DISPLAY.
As user I am thinking in cpu-power, compiling, calculating, wordprocessing.
In X convention any dump terminal at any computer is a DISPLAY-SERVER
while the computer itself is its CLIENT.

So I am not glad about that convention.
But convention doesn't need to be senseful or intelligent.

Thank you for correcting me

Stefan

> Is this common ? Is it software, hardware, me ? Can it be fixed ?

This is normal. The drives share a single motor-on line, and both drives
respond to the motor-on signal. (I presume that the ultimate reason is
so that you can spin-up a drive before you select it, to get it up to
speed.) The quick answer is that it can't be fixed, I suspect, unless you
want to add some more (hairy) circuitry to the ST and probably modify TOS
as well. Or, in other words, no, you learn to live with it.

From: dnd15j9z@umiami.miami.edu
Message-ID: <6799.26d10343@umiami.miami.edu>
Source record: 239183

Ok, I have an Atari SH204 20 meg hard drive, which is very old. It was formatter with AHDI 1.0 or something old like that. The hard drive crashed and I also lost my copy of AHDI, so I got the ICDUTILS from terminator.

Everything seemed to format correctly (using tandon 262 drive and Adaptec 4000 controller.)

I configured 2 partitions, C:5.41 megs, and D:16 megs..

Everything formatted and all, but now any time i get a file selector box (TOS 1.4) where I can select the active drive, all the drives up to like drive M are available. Does anyone know why? Do I HAVE to have the ICD adapter in order to properly use the software.

If so, WHERE CAN I GET A NEWER VERSION OF AHDI WHICH SUPPORTES PARTITIONS OVER 16 MEGS!?!?

-Frank

I guess the header (Subject & Keywords) say most of it.

I recently got the cpm emulator for the ST and installed it on my system.
Following directions, I'm supposed to format a single sided diskette
and type make_cpm. This make a CPM diskette OK but the next step is to
boot up CPMZ80.TOS, insert the disk I just made and after following
the prompts and getting a A: prompt, I'm supposed to type INIDSK a:
The proble is that when I insert a freshly TOS formatted disk (or any
for that matter) I get a 'DISK NOT EMPTY' error and inidsk aborts.
That's one error. Another is that according to docs, the TOSCPM
utility is supposed to copy from drive a to drive a prompting for
diskette changes. When I try, I get an error stating something like
'SOURCE and DESTINATION disks are the SAME' then aborts.

Well, I give up! I am running TOS 1.4. Could this be the problem?

Any help or hints would be appreciated!

THANX in ADVANCE, Paul Moreau.

1370. FTP Help File

Newsgroup: comp.sys.atari.st
Date: 1990-08-21 17:07:54 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1990Aug21.170754.5485@terminator.cc.umich.edu>
Source record: 239190

This is a little FTP help file that I threw together. I hope somebody finds
it useful. Please let me know if anything is unclear or if anyone thinks
any changes should be made. Also, please distribute it to anyone who may
need it.
Thanks,
Jmw

Atari.archive.umich.edu FTP Help

Welcome to the wonderful world of FTP! This file is designed to help you
move around the FTP world easier and more efficiently. Any questions,
problems, comments or concerns should be sent to weiner@atari.archive.umich.edu.

Part 1: Logging on
The first thing to do is to log on to your ftp host. This is done by issuing theappropriate
ftp command on your computer, such as 'ftp internet address #' or
'ftp atari.archive.umich.edu'. Assuming the host is up and operating properly,
you should see something like this:

Connected to 'some internet address #'
220 atari.archive.umich.edu FTP server (Version 4.172 Wed Jun 28 16:09:38 EDT 19
89) ready.
Name (35.1.33.8:weiner):
At this prompt, type 'anonymous'.
Now, you'll see this prompt:

331 Guest login ok, send ident as password.
Password:

Reply to this prompt with your mail address, in my case that would be
weiner@atari.archive.umich.edu.

Now, the host should reply,
230 Guest login ok, access restrictions apply.
ftp>

Part 2: Seeing what's there

Now that you are logged on to the host, you'll probably want to see what's
there. To do this, use the 'dir' command. It will print out
a list of directories and/or files. To *enter* one of these directories,
use the 'cd directoryname' command. To go back a directory, use 'cd ..'.
With these three commands, you should be able to make your way through the
archive.

Part 3: Gettin' some goodies

While manuevering through a ftp site, you've spied that game you've been
looking for for such a long time. In order to transfer it to your site,
you'll need to use the 'get' command. There's a catch to this however:
Unless the file is a text file, you'll first need to issue a binary
file type command. It should look something like 'type binary'.
Then, you're all set to transfer away!!!

Part 4: The download

Here's where each system differs. You'll need to use some sort of file
transfer system like Kermit, X-modem or Y-modem. Each system has its own
little quirks, so it's best to ask around your area for help here.

I hope this has been some help to those of you without ftp knowledge. If any
one has any suggestions, questions, or comments, please mail them to:
weiner@atari.archive.umich.edu, or jeff_Weiner@ubmts.cc.umich.edu

Please forward this to anyone who would like a copy, but please keep it intact
and do not alter it in anyway. Thanks,
Jmw

1371. zoo201 unpacking problems

Newsgroup: comp.sys.atari.st
Date: 1990-08-21 18:24:15 UTC
From: fischer-michael@CS.YALE.EDU
Message-ID: <25848@cs.yale.edu>
Source record: 239184

Zoo version 2.01 on the ST seems unable to create folders. For example,
when I try
zoo x//. gemlib.zoo
I get:
Zoo: ERROR: Can't open gemlib/Changelog for output.
Zoo: ERROR: Can't open gemlib/Makefile for output.
etc.
The Unix version of the same program works fine. It's as if the Atari
version doesn't know to convert "/" to "\". The code I am running was
just FTPed from atari.archive.umich.edu at path
atari/gnustuff/tos/zoo.ttp, although I had the same problem with an
earlier version that I took off of comp.binaries.atari.st. Has
anyone else had this problem? Anyone know of a version that works
correctly?

> I get an error (cannot create output file). This is a problem, since

You need to either get a new set of binaries (avail on picasso.ces.cwru.edu or dsrgsun.ces.cwru.edu) or compile all the executables again, using a newer version of the library startup file crt0.c (library Patchlevel 56 or better). The problem is with RTX that does not follow all the atari rules when launching an application (specifically clearing A0 on an application launch vs. A0 == basepage for an Acc launch). This newer crt0.c does'nt depend on this fact any more (to detect acc startup) and works just fine with RTX (and others like PACK etc).

> sources to gcc 1.37 from Terminator, but I have no idea on earth how
> to extract gcc-cpp from that mess to compile it on my ST.

Huh? Just look at the supplied makefile.

>By the way, does gdb work with gcc 1.37? I remember seeing a message
>claiming that it did not, but it was a little confusing. Thanks.

yes, its true. gdb doesnt work with gcc 1.37. in fact -gg support has completely disappeared from the new version of gas (1.36) (this newer version is available from dsrgsun/picasso.ces.cwru.edu for both minix and tos).

cheers,

1374. Help with PC-Ditto & BMS200/ST277N booting MS-DOS

Newsgroup: comp.sys.atari.st
Date: 1990-08-21 19:21:43 UTC
From: hearn@skivt.enet.dec.com
Message-ID: <2544@ryn.esg.dec.com>
Source record: 239198

I've got a 1040STf with a SEAGATE 277N running thru a BMS
Berkely Microsystems) 200 controller. I'm trying to get
PC-Ditto to 'boot' from the hard disk, but PC-Ditto never
"sees" the drive C as bootable. I've followed the PC-
Ditto procedures exactly (to the best of my knowledge), and
talked to Chris at BMS (PLUG: Chris has been excellent in both
his attitude and knowledge on his product; also his willing-
ness to help me - I purchased his product used) who does
have PC-Ditto working on his equip. I've used his procedure
and still no-go.

Would anyone have any ideas as to what I could be doing
wrong?

Any thoughts or explainations on how PC-Ditto (v3.01)/MS-DOS (v3.30)
"works" would be appreciated.

Tnx,

Rich

1375. Request (again) for TOS 1.4 docs

>drive M are available. Does anyone know why? Do I HAVE to have the ICD
>adapter in order to properly use the software.
>
>If so, WHERE CAN I GET A NEWER VERSION OF AHDI WHICH SUPPORTES
>PARTITIONS OVER 16 MEGS!?!?
>
>-Frank

There are several solutions to the " Ghost drive " problem. AHDI
is up to version 3 which supports larger partitions. It should be available
from local bbs's, it's definately on GEnie,and,if your lucky enough to have
a local store,he should supply you with it.
Berkely Microsystems makes a replacement PAL for the ASCI board which
stops it from claiming to be every drive under the sun. Their address has been
posted frequently but I don't have it.
There is a program called HDFIX of ICDFIX or SUPFIX which patches
the earlier freely available Supra and ICD booters to ignore the atari
asci boards claims. The fix program should be available the same places as
AHDI but if not (it's quite old) I'll send it to comp.binaries or somewhere.

John Henders
Vancouver,BC

p.s. Has anyone found reliable mail paths to the German guys running Rodney's
UUPC modules. Everything I try seems to bog down somewhere around snorklewacker.

(re X client/server)

|> Anyway this name convention isn't intuive.
|> In general a server offers a service. A client uses this services.
|> (Think in fileservers, diskless cluster, ..)

Here's how I try to get it across when I do X presentations.

In the traditional client/server paradigm, the client is the program that has the actual application smarts. The server is just the dumb part. Think of a database server; it doesn't initiate any useful computing. It simply does what the client tells it to, request by request.

Similarly with the X server. It's dumb; it's a slave. It accepts drawing requests from the client program and input events from the user and does what it's told, usually without any information about the purpose of the application being executed.

Unfortunately our earlier experiences have led us to think of the client
as closely identified with the human, and the server as over there somewhere in another room (or another country). That's why the X paradigm *feels* backwards; the server is always under the user's nose, and the client could well be on Mars (requiring a longer WM_TIMEOUT value :-).

Having said all that, it usually takes a couple of months for new X people to get comfortable with the nomenclature; mistakes are usually forgiven...

> jobs when it sees '.ttp or .tos'. Ahh to dream.

pipes do not need multitasking. a pipe stream (like "ls -l | grep ttp") must be done serially (the "ls" must occur before the "grep"). job control and "&" jobs, on the other hand, would be very nice indeed.

on a related note, what, if any, scheduling options are available with RTX? is there any sort of priority scheme?

note that the bash described at the site in .de (germany) is source only. (at least when i checked 8-10 days ago). i don't have room on my 60MB hd for gcc (yet) :-(so it would be REALLY nice to have a .ttp there (or posted).

I've sent half a dozen queries to Rodney with no luck.

Never route anything through snorkelwacker. It's a news-only system
-- it does not handle mail.

The "Path: " line in Usenet news is intended for preventing loops.
Abusing it to create UUCP mail paths is suboptimal at best and
often sends your mail into a black hole.

> overal Dow has lost since Aug. 2.
>
> Draw your own conclusions.

Ummm ... you haven't provided enough information from which any valid conclusion may be derived. Here is a list of information which I would require in order to come ANY conclusions:

1. How have other computer-related stocks fared?
2. Are there other stocks which have dropped in value by similar amounts?
3. What are they?
4. What is the current VOLUME of Atari stock being sold?
5. Compare and contrast this with the VOLUME of other computer-related stocks being sold.
6. Do the same for the answer to question 3.

It would be pretty stupid to base conclusions on one stock without knowing something about the rest of the field to which that stock belongs. It would be equally stupid to base conclusions about a company based on stock prices in a widely fluctuating market.

As an example -- the Dow Jones average has dropped nearly 400 points over the past few weeks. People came to attention when the Dow dropped 500 points in one day, but don't appear particularly bothered by a similar drop over a few weeks time! The net loss (on paper) is similar, although the time frames are not.

1391. Atari Stock Update (hit n now if you don't want to read this)

Newsgroup: comp.sys.atari.st
Date: 1990-08-22 13:55:27 UTC
From: cmm1@CUNIXA.CC.COLUMBIA.EDU
Message-ID: <CMM.0.88.651333327.cmm1@cunixa.cc.columbia.edu>
Source record: 239108

Atari sagged another point yesterday to close at 3 1/8. It has lost
nearly half of its value in the last week. It has declined roughly 4
times the amount of the general market since the invasion of Kuwait.

Cheers,

Chris

If you are looking for some free GEnie access time to 'check it out' you will have to wait a very long time - GEnie sometimes does make an offer in the magazines for a free signup and the first 2 hours free connect time. I got my free sign-up by buying a modem which had such a offer with the modem-package.

You can sign up with GEnie by dialing 1-800-638-8369, after the U#= prompt enter: XTX99694,GENIE . You'll get some info on GEnie, and then your asked if you want to join, if the answer is yes prompt for billing info follows, else it disconnects. (note: if you join, I believe you are charged something around $ 25, this price includes a user's guide which is mailed to you, but I am not sure about this).
Settings required: 8 data bits, 1 stop bit, no parity, half duplex (local echo), 300 / 1200 / 2400 baud is accepted.

No thanx... :-) Since I'm definitly not what you would call a *nix-
wizard, I see no chance of getting the stuff work :-) 2nd problem
is - I have no longterm local access to a *nix-computer... patching
300k with 2400 Baud would be a little bit - let's say _boring_...

But if there's any soul reading this who has done this, or who knows
where to get it ... pleeezzz tell me :-)

> posted).

The binary of bash can be found in directory ~ftp/atari/bin on
cs.uni-sb.de [134.96.7.254]. Although it does not have the .ttp
extension, it is executable. The binary is packed with the
pack-program posted in comp.binaries some time ago. The real code size
is ~250 kB.

Earlier you wrote:
> pipes do not need multitasking. a pipe stream (like "ls -l | grep ttp")

> and "&" jobs, on the other hand, would be very nice indeed.

This port can do pipes without multitasking. The example above is
translated into:
ls -l > {temporary filename} ; grep ttp < {temporary filename}
But pipes don't have to be done serially. They are better done in
parallel.

I cannot resist the temptation: even job control can be done without a
multitasking kernel. The shell Master (demo posted on comp.binaries
and also available on cs.uni-sb.de in file ~ftp/atari/shell/master.lzh)
can do pipes and job-control (meaning: stop jobs, list them with the
"jobs"-command, kill them with "kill" and restart them in any order
with "%{Job-Id}") without multitasking.

I haven't used CP/M since before installing TOS 1.4, so I tried it again
and couldn't get it to work. If I remember correctly, the CP/M emulator
was developed by Atari. But then my copy of Logo hasn't worked with
1.4 either.

Why doesn't our beloved Atari stock analyst provide more stock information of stocks of other computer manufactures, say, IBM, HP, DEC, or even Commodore? We could all learn about how they perform (or should we say how the market expects them) in the recent Kuwait crisis.

You don't need to be an Atari fan to own Atari stocks, nor you don't need to be an Atari stock holder to own an Atari computer. Get real.

The binary of bash is now also at Terminator (make that, Atari Archive -- 35.1.33.8).

It is called "bash-bin.lzh" and is approximately 118K.

> +---+

There is a very intersting piece of software which has become available at most (UK) public domain software distributors - a Sinclair ZX81 emulator for the Atari ST!

For those of you who are not familiar with the ZX81...

The ZX81 was (Uncle) Clive
Sinclairs followup to his ZX80 home computer. The ZX81 (like the ZX80) was available in kit or pre-built form, and boasted a Z80 CPU, 1k of RAM (16k if you bought the slot on RAM pack - which suffered from the infamous "wobble"), a membrane keyboard with each key boasting no less than 5 or 6 functions (!), 16K (?) ROM with built in BASIC. The ZX80 was released in 1980, and was arguably the computer which set alight the UK home computer scene. Although the ZX80 could display a steady picture on the TV screen there was a loss of sync every time a key was pressed and also every time a program was run, because Uncle used the Z80 CPU to refresh the screen when it wasn't otherwise busy. The ZX81 released in 1981 fixed this, although still maintained a FAST mode for running programs, where the screen would disappear ala ZX80.

The ZX81 emulator is supplied with a number of ZX81 games (originally they came on cassette) thankfully loaded from disk. The copyright situation of the games and ZX81 ROM code may be dubious, but I doubt if more than a handful of people still use this beast (I recently saw one sold at an auction for a single pound!). Pressing the ST HELP key displays a very clear graphic of the ZX81 keyboard - this is essential as single keypresses enter multiple characters e.g. pressing "K" prints LOAD " on the screen (you then type the filename normally). The emulator emulates the 1k, 16k or 48k (wow) machines. Some of the games which fitted into the 1k, put some of the ST gargantuans to shame. The emulator also correctly emulates the FAST mode mentioned above.

It has to be seen to be believed.

You could if you wished program the Z80 in assembler (in fact there may have been one on the disk). The normal way to load a machine code program was to

have a REM statement as line 1 with lots of characters (more than the length of your machine code), then poke the machine code into RAM byte by byte (in decimal!) which would overwrite the characters following the REM statement. When listed it looked like total gobbledegook, as the machine expanded out each byte into its token textual value. Believe me it wasn't easy (it was easy to crash the machine though! and the only way to reset the computer was by pulling out the power supply plug!!!!!!)

Sigh! Those were the days. I wanted a ZX81, but couldn't afford one, so I had to stick to my ZX80.

Thanks to all who responded to my problem with zoo not creating directories. There is nothing wrong with the various versions of zoo I was using---the problem was the way I was calling them from msh. I was typing zoo x//. filename instead of zoo 'x//.' filename . The quotes are necessary because "/" is the escape character in msh. I have been using Unix too long to think of anything except "\" as the escape. Sorry for being so quick to post news about this---a little more experimentation would have enabled me to figure it out for myself.

1404. Re: Atari Stock Update (hit n now if you don't want to read this)

Newsgroup: comp.sys.atari.st
Date: 1990-08-23 03:23:16 UTC
From: saj@chinet.chi.il.us
Message-ID: <1990Aug23.032316.2096@chinet.chi.il.us>
Source record: 239126

I've really tried to keep a cork in it over this. Approximately 82% of the common stock of Atari Corporation is in the hands of insiders. The action of the stock price is not comparable to the action of the price of a broadly held stock. The <unprintable> who decided he didn't like Atari and is now a cheerleader for the (groundless) idea that Atari is about to fold claims to know something about securities analysis. If his employers believe that, we can expect a large bank to fold its US operations before Atari folds. This same person was surprised to find out that the financial reports his employer pays some thousands of dollars for are considered proprietary information. He has also beamishly repeated predictions of disaster for Atari after being shown that basically, Atari must inevitably show several good year-to-year earnings compariasons (which, by the way, probably has a lot to do with why people who didn't own Atari stock didn't scramble to buy it: the smart ones expected the improvement).

This forum is a convenient place to swap information about STs and programs for them. One plausible-sounding jerk can give new readers a badly distorted idea of what's going on. Sure I could hit 'n', but this guy's a menace.

A little of what I consider the truth: Atari had a decent quarter. They seem to have finished putting the losses from the Federated catastrophe on the books (if they had put the whole mess out at once, they really would have had to declare bankruptcy). They are still selling all the machines they are able to make (yeah, I'm a little bitter about the small number they're able to make). The stock is very narrowly held, which makes it EXTREMELY volatile. For Atari to have another decent quarter, they don't have to do anything new. They have several opportunities to generate good rather than decent results: any reasonable TT introduction, any reasonable 'Christmas ST' package, a second generation Portfolio or major Christmas sales of Lynx could be REAL helpful. I don't expect any of those, but again: Atari can have decent results without them.

So anyway: whatever you think of the ST or of the way Atari Corporation deals with people, they are staying in business as long as the chairman wants them to stay in business.
Steve J.

I challenge you to find a significant number of tech stocks that have lost ~50% of their value in the last 2 weeks. As a matter of fact, techs have been weak for well over a month and I challenge you to find a significant number who have dumped this far in that time as well.
>
>You don't need to be an Atari fan to own Atari stocks, nor you don't need to

I don't remember making this assertation. I finally have the extra cash to buy a BETTER computer than my ST. It no longer does what I require of it so I think that I am "getting real."

Cheers,

Chris (our beloved stock analyst) Mauritz

>

I've not tested this properly, but an old copy of the CP/M emulator I had didn't work on my TOS 1.4 1040 at work. I tried out a (different) copy of the emulator on my STE at home, and to my surprise it ran fine (at least, it loaded OK and I could list a directory, which was all I tried.) I haven't taken home my disks from work, or taken to work my disks from home, so I may just have one bad copy.

As they say in the food guides, more reports please!

>No, the vice versa is true.
>The SERVER run the program
>The CLIENT is just the DISPLAY.
>
>Stefan

No, Steven Grimm is correct.

In the terminology used by the X window system, a "Server" provides a service to "Client" applications. The display is controlled by a "Server" process. The "Client" is an application which may run on the same machine or over a network.

This may sound backward to those not initiated, but it actually makes a lot of sense. Consider that a single X windows server can have multiple clients accessing it at once. This is, in fact, the usual case, since the window manager is a client application as is whatever application that may be in direct use by the user. It is true that a single client application may use connect to several servers, but this is not very common.

Enough said. End of thread.

Hallo!

I do not believe that all that discussion about which part is the client and which is to be called the server answers the question indicated in the subject line! So let's try to answer whether there is any Xserver (Xatari? compared to Xapollo, Xsun, etc.) available for the Atari ST series.

Atari Germany is selling such a thing! Don't ask me things about the performance, the prices, the requirements etc. Just call Mr. Mester at Atari Germany, Frankfurter Strasse 89-91, D-6096 Raunheim, Fed. Rep. of Germany , Tel.: +49 6142 2090. They are showing it on the Atari exhibition in Koeln (Cologne) and he will be back in Raunheim on Monday. This is a product develloped by a little softwarehouse in Bavaria (near Munich) and it is available since this exibition (now). So there are up to now nearly no persons who can give answers to questions concering this piece of software.

Sincerly,
Matthias

Thanks for the very nice summary of the ZX81, Gary; your
description of poking Z80 code directly into REM statements brought
back some real memories. :-) :-) (I still have two of the critters
collecting dust in my basement somewhere. Well, actually one of them
is the Timex-Sinclair flavor retailed by our favorite cheap watch
company on this side of the pond, with twice as much RAM -- a whole
2K!)

Since the emulator your describe is PD, is there any chance that
your could get ahold of a copy and send it to Steve Grimm at Panarthea?

Really? And just exactly WHAT are the dynamics by which you have carefully studied the situation and are able to make such assessment? One might as well thank Chris and all of those related to the stock market for their aid in decreasing the worth of Atari stock by half in the last month.

Such foolishness does not deserve to be spread via comp.sys.atari.st.

By the way, Chris -- does your employer know you're providing these 'insightful' analyses? What is their 'official' position on Atari stock?

Awww, God bless you for being so considerate. After all, this group does
exist to exchange ideas. Why not exchange em?

>Approximately 82% of the
>common stock of Atari Corporation is in the hands of insiders.

Big deal. There are a lot of closely held companies out there that
haven't dumped half of their value in the last week or so. BTW,
ATC is trading at **2 5/8** as of 4pm Wednesday. What's your point?

>The action of
>the stock price is not comparable to the action of the price of a broadly held
>stock.

You are full of it. I suggest you reread your correspondence course text
of stock analysis. The shares held by insiders are not really a consideration
in this context. You may as well imagine that they don't exist. If the
insiders hold them, there is no net effect on the AMEX price of the stock. IF
they sell any shares, the increase in publicly held shares with the same
basic fundamentals will cause the price to fall. Again, what is your point?

>The <unprintable> who decided he didn't like Atari and is now a

I guess that is me. It sure is nice to be so loved. And you are right,
I do not like Atari Corp. I like their product, but the company is on
very shaky financial ground. I don't think you will be able to find
a single financial analyst who will disagree with that. They are
cash poor and have no hope of raising reasonably priced funds due
to their crappy bond rating. They can't raise fund in the stock market
because nobody wants to touch their stock. It dropped 1/2 point yesterday
to 2 5/8 on 3.5 times its normal volume.

>cheerleader for the (groundless) idea that Atari is about to fold claims to
^^^^^^^^^^^^
Hehe, pull your head out of the sand and accept the numbers pal.

>know something about securities analysis. If his employers believe that, we
>can expect a large bank to fold its US operations before Atari folds. This

Well, that is one aspect of my job. I have received a lot of training
for this. What do you claim to base your knowledge on? Did you find
a Stockbrokers Guide to the Universe inside a box of cracker jacks?

>He has also beamishly repeated predictions of disaster for Atari after being

If by "disaster" you mean that I said that they were in trouble, then
you are correct. They are. I have said several times that I don't think
they are iminently going Chapter 11.

>shown that basically, Atari must inevitably show several good year-to-year
>earnings compariasons (which, by the way, probably has a lot to do with why

Who showed me? Where? When? Show me again! I must have missed that
brilliant piece of analysis. They haven't earned a respectable profit
in years. Who are you kidding?

>people who didn't own Atari stock didn't scramble to buy it: the smart ones
>expected the improvement).

No, it goes more like this: The people who owned the stock before took
such a viscious paper loss that they are reluctant to sell and realize
their loss. People that were smart enough to stay away from the dog
are sitting back and laughing to themselves at those who are too pig
headed to admit they've been bitten. The stock market is generally
pretty efficient about discounting future earnings potential and this
is now showing up with the historic lows for Atari stock.

>This forum is a convenient place to swap information about STs and programs fo\
r
>them. One plausible-sounding jerk can give new readers a badly distorted
>idea of what's going on. Sure I could hit 'n', but this guy's a menace.

Well, who is the plausible jerk? It is interesting that you are resorting
to name calling. The is the normal tactic for a person with no grounding
in reason. I guess that is apparent when you say that a person who is
presenting hard fact is a menace. That is certainly the kind of "menace"
that Atari needs to get their act together.

>A little of what I consider the truth: Atari had a decent quarter. They seem
^^
Ah, another pearl of wisdom. I can't wait. Decent quarter??? Hahahaha!
Yeah, maybe decent because their profits have been practically non-existant
for so long that anything seems an imporvement. This is NOT a sound basis
to say they had a "decent" quarter. They had a BAD quarter. It just doesn't
look SO bad because the ones before were horrid.

>to have finished putting the losses from the Federated catastrophe on the

No, I don't think they are even close to putting the Federated mess behind
them. They are trying to stretch it out as long as possible. Believe
me, Wall St. is not stupid. If the stock is trading as such a tiny price
there IS a reason for it. The stock market is a VERY efficient market. If
people were interested in the stock and wanted to buy it, the price would
go up. BUT THEY AREN'T!! Are you saying that all these investors are
"menaces" and that they "don't know what they are doing", ad nauseam...

>The stock is very narrowly held, which makes it EXTREMELY volatile. For Atari

Actually, until recently I hasn't been volatile at all. It has been
following a nice long steady curve in the downward direction. It
hasn't made any big movements up or down until very recently. If you
had been studying the stock you would have noticed this. There have
been no big surprises with this stock (until recently obviously).

>to have another decent quarter, they don't have to do anything new. They have
>several opportunities to generate good rather than decent results: any reason-
>able TT introduction, any reasonable 'Christmas ST' package, a second generati\
on
>Portfolio or major Christmas sales of Lynx could be REAL helpful. I don't
>expect any of those, but again: Atari can have decent results without them.

This has all been discounted by the market already. People take this into
account when they value a stock.

>
>So anyway: whatever you think of the ST or of the way Atari Corporation deals
>with people, they are staying in business as long as the chairman wants them
>to stay in business.

Which is probably going to be a long time. I'm sure it makes a hell of a
tax shelter for the Tramiels.

> Steve J.

Chris Mauritz

p.s. Let's see what happens if/when shooting starts in the Middle East.
The Japanese Yen will take a nose dive. What does this have to do
with Atari you ask? Plenty! Atari's main trade facility is
denominated in Yen.

This would seem to imply (I know nothing of the stock market) that just a fraction of the stock outstanding is being trading by the insiders (presumably to outsiders) and that this has a highly leveraged effect on the overal price. True?

>For Atari to have another decent quarter, they don't have to do anything new.

Here where I work, Network Systems, we just previously had the two best quarters in the company's history, yet our stock (after nearly doubling) has fallen again (nearly in half of the previous high.) From our current price, one might conclude that we have accomplished nothing!

Stock prices and company performance have some tenuous link, but not enough to make money on the anticipation of such :-)

Message-ID: <1990Aug23.181723.19210@cunixf.cc.columbia.edu>
Source record: 239133

Recently, Stephen Jacobs tried to impress one and
all with his brilliant knowledge of the Atari
stock situation. However, one of his key numbers
was completely inaccurate. Atari is NOT 80% owned
by insiders. It is 32.61% owned by insiders.
This number was found by consulting filings with
the SEC.

For those who want accurate information:

Investor	Date	Change	Held	% Own
Invest. Cos	3/31/90	0	0	0
Institutions	3/31/90	-299	2,863	4.96
5% owners	6/30/90	Na	39,673	68.80
Insiders	5/31/90	Na	18,804	32.61

Note: The numbers do not add up to 100% as some
of the 5% owners may be insiders.

These brilliant insiders can thank Jack and Sam
and the rest of the gang for decresing the
worth of their stock by more than half in
the last month.

Cheers,

Chris

Stefan> No, the vice versa is true.
Stefan> The SERVER run the program
Stefan> The CLIENT is just the DISPLAY.

Stefan> Stefan

I'm sorry, but you are wrong. The SERVER ist the program which
controls the physical display of your machine, i.e. Xsun or Xhp are
Servers.

The CLIENT is the program which sends protocol messages to the server,
requesting drawing and such, i.e. xdbx, xterm, xclock, twm, ... are
clients.

Source record: 239148

Hi! Yesterday my monitor died, or at least it seems that way. It seems to be still getting power because the green light is on, but the screen is totally blank. I would appreciate any help like hints of what could be wrong and how to fix it or advice about sending it to Atari for repair, or whether any TV repairman would repair it, or any experience you have had with dead monitors. By the way, how much does a (new or used) mono monitor cost? And is there anybody willing to sell one? Thanks in advance!

1423. Problem: DA memory allocation by TOS ... heavy consumption

Newsgroup: comp.sys.atari.st
Date: 1990-08-24 04:04:39 UTC
From: moses@hao.ucar.edu
Message-ID: <8317@ncar.ucar.edu>
Source record: 239142

I have created a relatively large desk accessory program for the ST
using GFA BASIC, and the problem I am having is that TOS is allocating
twice as much memory as is needed for the accessory.
Adding up the executable file header information and also the
Malloc calls, used for buffers, to get a total memory requirement and
also having used as few global variables as possible, there is a memory
requirement of ~170 Kbytes. But TOS is handing over 325 Kbytes of memory
to the desk accessory.

IS THERE A WAY TO REDUCE MY D.A.s MEMORY CONSUMPTION? TOS AUTOMATICALLY
SHRINKS MEMORY FOR EACH D.A. BUT APPEARS TO DO A POOR JOB OF IT.

Thanks for the help.

1424. Re: Atari Stock Update (hit n now if you don't want to read this)

Message-ID: <1990Aug24.060014.28210@chinet.chi.il.us>
Source record: 239053

Ok. My basic stock market credential is 28 years of experience. I won't go into the book training, but there's some of that too. And the fact that Chris Mauritz thinks stock in the hands of insiders can be ignored again shows that he thinks with his wisher: what happens when Jack wants a bit of cash? Could he maybe sell stock equivalent to half a percent of what's on the market? Would that have an effect?

Wanna tech stock that's lost half its value lately? Try Lotus Development. I'll sell you some nice $10 puts on Lotus that'll be worth something when it goes bankrupt. I mean, if losing half its stock market value means a company is going down the tubes.....

Is the stock market efficient? Over some time span, sure. Mostly. Every big day-to-day move shows that it isn't efficient in the short term. Every corporate surprise shows it has some longer-term inefficiencies.

But this is the Atari ST group. The question is whether Atari Corporation is going to be there, in the computer business, giving whatever backing they give users, in the future. Chris Mauritz doesn't say it right now, but in the past he's sure said that Atari is about to fold. Now he's just saying that they'll be too weak to do anything for their customers. So here are some nice concrete predictions that mean something to customers. Redeemable in six months (gimme a week: March 1, 1991). The program of exchanging defective items for a fee will still exist (that's a pretty good repair policy for a computer company). There will be STe-s for anyone who wants to buy them. All 3 announced sizes of STacy will be available to anyone who wants one. The TT will be in the hands of developers. At least one major system software improvement for the ST will be a topic of discussion, or perhaps available. Not very spectacular, but Atari hasn't been spectacular in a while. What it is, is the kind of things that wouldn't be there if the company folded or was crippled. And just for jollies: let's say another 3 cents a share earnings reported in November, and a nickel in February. But that's kinda beside the point.

So far nobody's told me to shut up. If you want me to, email me.

Steve J.

1425. How to install Smalltalk 1.1

From the Proxy statement distributed in connection with the May 15 Shareholder meeting:

Jack Tramiel is beneficial owner of 43.8% of outstanding Atari common stock
Warner Communications is beneficial owner of 24.6% of outstanding stock
Sam Tramiel is beneficial owner of 1.8% of outstanding stock.
Other directors and executive officers own about 6% of the stock (by subtraction)
Amounts of stock equivalent to about 4% of all outstanding are held directly
or in trust by other Tramiel family members.

Papa Jack has more than Chris says all insiders combined own. So who do YOU want to believe?

No, .Z means that the file is compressed with program compress. It's a unix software and has been ported to many systems, including ST. If "your" VAX has compress/uncompress program, you can use VAX to uncompress files. Another possibility is to get compress program from terminator and uncompress files on your ST.

TAR is a program to pack many files into ine file for writing them to tape, for example. There is version of GNU TAR for ST too. TAR's file name extension is .TAR. Don't know about ST version, but a unix version of GNU TAR can also compress files while packing them.

Some time back there were numerous postings concerning the (in?)famous
Chinon floppy drive. As I remember, many people had problems with its
media change detection.

What were the conlusions of those postings? My new Mega 4 ST has a
Chinon Rev B F-354 EAA drive in it. It has been sent back to the
dealer to fix the `media change problem'. I'm curious as to what
official solutions that were made available.

Suggestions are also appreciated. Is there a good test program for
this problem? Please try to reply to me directly and I'll summarize
if anyone else is in the same boat, and interested.

1429. Partitioning a Hard Disk for Spectre

Newsgroup: comp.sys.atari.st
Date: 1990-08-24 13:22:07 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <4272@rodan.acs.syr.edu>
Source record: 239146

I've got a 20 meg ST225 currently with three partitions:
C:5MegGEM, D:5MegGEM, E:10.25MegSpectre. This is on an ICD
Fast Kit. Is it possible to repartition the Spectre
partition into two smaller Spectre partitions, say: 1.5Meg and
8.75Meg? (I'd like to keep my system folder in the smaller
one.) I tried something last night, but it messed up the
whole drive so much that it took me quite a while to get back
to where I started from...now I don't remember what I did and
don't want to do it all over again. Can anybody help out?
Thanks very much.

Source record: 239052

Has anyone had any luck hooking up a Microsoft-compatable mouse to the ST
to the ST's standard mouse port. If not, does anyone have any drivers for
using it connected to the serial port? The problem I have found in hooking it
up to the mouse port is that it required 12 volts for operation and the port
only supplies 5V. Please let me know if anyone has any suggestions.

Hello....

I seem tro have a problem with my st. I was using it last night
and all of a sudden I could no longer access the floppy drives...
So I shut it off and tried rebooting. I still could not access the
drives. The weird part is when it boots up, it recognizes the drives being
there I just cant do anything with them? It always boots in low res
and I tried creating a folder on the disk and was not able to. Also
when I opend a window with a directory it showed me nothing.... I am
fairley sure it is not a problem of the drive, because I have two and trie
hooking them both up alone and got nowhere. Anybody got any clues?

I think it may be the DMA chip?

Stock.... Shlock.
Atari US could/may? fold up tomorrow... big deal. I've been (past) an avid
atari fan/ programmer for many a years (can everyone say poverty? Piracy?
blatent MASS theft? Promises? Edsel? I knew we could). The big question is
how much can the consumer get beat. Yell at oil companys for some added
pennys... Support a company that does not support the consumer. It's a mute
point I gather? Regardless... Atari US (<- see!) will NEVER sell me another
item no matter how "good" it is. Fool me once your the fool, twice++ I am.
Besides, w/ Windows 3.0 lookin' MIGHTY FINE and all the goodies/possibilitys
available for PC's why look further? I'd assume consumers want the BEST they
can get for their respective bucks (those that dont pay $2.50 a gallon for gas
when the pump price is 1.09 right?) so why get less in any capacity be it
Mips, support et al. Or!.... are we all perspective edsel buyers?

>Atari for repair, or whether any TV repairman would repair it, or any
>experience you have had with dead monitors. By the way, how much does
>a (new or used) mono monitor cost? And is there anybody willing to
>sell one? Thanks in advance!
>
> Francisco Figueirido

If you decide to send it off to have it repaired, I suggest:

R&R TV-Stereo Service
Bldg. 209, Area C
W.P.A.F.B., OH 45433
(513)-878-6696

If you call them, talk to Ron. They were recommended to me by
Best Electronics. My mono monitor had died (even the green led
was out), and I called Best Electronics who recommended R&R. So
I sent them my monitor on a Monday, they called me on Friday with
an estimate on the repair cost, I sent them a check Saturday, and
by the next Friday I had my monitor back in working order. It cost
me $56, including shipping, for everything. I have had some bad
experiences with Atari related repairs before, but R&R gets five
stars out of five.

1439. Re: Atari Stock (now: what good is Atari?)

Newsgroup: comp.sys.atari.st
Date: 1990-08-25 13:59:55 UTC
From: saj@chinet.chi.il.us
Message-ID: <1990Aug25.135955.24781@chinet.chi.il.us>
Source record: 239059

Jeff Gortatowsky (apologies if I spelled the name wrong) chose to re-open some serious issues in a follow-up to one of my postings. I may as well make some comments too.

First: a PC-compatible running Windows (or presumably a lower-priced Mac, after the announcements Apple is expected to make shortly) gives the user everything worth having in the ST, for less money, and with better support. True or false?

Still false, I think, but getting closer to true by the day. Let's say the standard ST today is an STe with a meg of memory; sale price about $750 (I'm kinda splitting the difference between color and mono). Stack it up against a 12 MHz 80286 with something that can handle graphics: That's at least $100 more. Performance on text-based applications is comparable. I'm told, though, that the 80286 won't run Windows usefully. Add another $70 for a Meg of RAM. Maybe $40 for a copy of Windows. Even now, the STe is faster on graphics.

Add a hard disk: the clone takes an internal disk, the ST takes an external one. For basic performance, you pay about $200 less for the clone's disk. But the ST's disk is a bit more than twice as fast in typical operations. Correctable, but that's another $100 into the clone. And if you like those removable platter hard drives, there's no contest: about $400 less to put one on the ST than on the clone.

Every Atari follower knows how dangerous it is to compare real and imaginary machines. Last I heard, the low-cost Macs expected from Apple were going to be priced more than the above clone and have no more than a meg of RAM.

Piracy: I'm sure it hurts plenty to be the victim. But if you think the ST is bad, I suggest you contact the author of Mean 18. Or of X-tree. The money being made is in a few blockbuster games, and in programs for the corporate market. A few people are making some money on utility programs (both PC and ST markets) but for each one of them, there's a story: why he makes money while the other guys with near-equivalent stuff don't. Programming is fun, and if you're good, it follows that you'll write good programs. Selling software is agonizing, and if you do everything right, sometimes it still doesn't work.

This note is much too long already. Next person's comments----

Steve J.

>Ok. My basic stock market credential is 28 years of experience. I won't go
>Chris Mauritz thinks stock in the hands of insiders can be ignored again
>shows that he thinks with his wisher: what happens when Jack wants a bit of
>cash? Could he maybe sell stock equivalent to half a percent of what's on
>the market? Would that have an effect?

It doesn't take an MBA to realize that if Jack did that, he'd lose a lot of money and would have to dump millions of shares to see any significant cash.

>past he's sure said that Atari is about to fold. Now he's just saying that

If you'll look back at my postings, you'll see that I NEVER said Atari Corp. was going to fold iminently. I've just been saying that they are in deep difficulty. Stop trying to put words in my mouth. If you want to quote my words, then do just that. QUOTE my exact words!

>they'll be too weak to do anything for their customers. So here are some nice

I think this is already the case. Actually, things have been like this for quite some time. For a company which tries to represent itself as a computer manufacturerer with eyes on the business market (hehe), their service is non-existent. They will NEVER sell computers in significant numbers with these policies in place.

>months (gimme a week: March 1, 1991). The program of exchanging defective
>items for a fee will still exist (that's a pretty good repair policy for a
>computer company). There will be STe-s for anyone who wants to buy them.

Big deal. No serious buyer of computers is going to wait weeks or months of downtime to get a computer repaired or replaced. The fact that there are so few Atari dealers out there only makes things worse. There are really few options for an owner whose ST breaks down. If the reduction of ST dealers in New York City is any indication, I can only imagine what things are like out in Idaho or Nevada, etc...

Regarding the STe...So what. The introduction of the STe was a non-event. All they really did was repackage the same old 68000 technology in a box with more joystick ports and a few minor hardware tweaks. I'm sure that really took a lot of R & D expense.

>TT will be in the hands of developers. At least one major system software

Well, if you'd read the Atari annual report, you'd notice that Sam Tramiel has stated (in writing this time!) that the TT will be

available for purchase in the second half of 1990. However, we all
know what usually happens when Atari people say the TT will be
available before time X....WOLF WOLF WOLF!!! FCC!! FCC!! FCC!!! whooopps,
we can't make them because we don't have enough money to buy DRAMS...
etc....

> So far nobody's told me to shut up. If you want me to, email me.

You shouldn't have to. These groups exist to exchange ideas. A
discusssion isn't fun if everyone regurgitates the company propaganda.

Actually, I think we're better off not discussing "which is better, an Atari or a PC clone?" Everyone here has different needs, and their decision is based on their needs. Lots of people reading this don't live in the US, and so the prices they pay and the availability of equipment is different from US readers. This discussion would be great on alt.religion.computers, but I'd rather not see it here.

From: gaines@msdrl.UUCP
Message-ID: <914@msdrl.UUCP>
Source record: 239063

Well, here's the deal.
Three months ago there wasn't a bigger Atari fanatic than myself...that is until their stock dropped from 14 to 5. Reality kicked in and I began to see that things were going from bad to worse. Who cares about the Lynx and the Hotz box? I dumped my Atari and bought another system (whose name shall be nameles...but close to an Atari system). At least now I don't have to worry about the company folding in the near future since it's one of the top computer companies in America.
Newsweek did a graph of the amount of personal computers on the market.
Atari wasn't even in the top 10. Now...people say that Atari is good for them.
Fine. But what happens when they fold? They're down to 2 5/8. Quite a drop from last year's 14.Atari STs may be good for you now....but think about what may come of them (and you) if they can't get their act together. Everyone's feeling the crunch from the Mid East, but in Atari's case, they never had anything to fall back on.

>Draw your own conclusions.
>

Great. In the last few weeks, Microsoft stock has taken a dive from about
$79 to $51. That's about a 35% dip. Gee, I guess that means that if Atari
stock only dropped 20% and is on the verge of folding (as some insightful
industry insiders would have us believe) then I should REALLY be worried and
start sending out resumes again. Poor Bill Gates. He's stuck with about
a hundred million shares of the stuff.

Can you Wall Street wizards take your discussion offline and leave this topic
for discussing matters that most ST users might actually give a damn about?
I'm sure you can set up a topic called alt.stock.market.bs or something.

From: ekrimen@csuchico.edu
Message-ID: <1990Aug26.173957.21084@csuchico.edu>
Source record: 239068

- Well, here's the deal.

Did someone say 'deal?' :^)

- Three months ago there wasn't a bigger Atari fanatic than myself...

Like me now?

- I dumped my Atari and bought another system (whose name shall be
- nameles...but close to an Atari system). At least now I don't have to
- worry about the company folding in the near future since it's one
- of the top computer companies in America.

What does a computer company do for you? It manufactures computers. Atari seems no different from other manufacturer, except that Atari has yet to advertise and promote their ST's in the U.S. :^) The support for the computer comes from third party products, which can do a much better job on a smaller level than a large corporation. I bought my 1040 because I needed a word processor for school and I knew that I wanted to get into telecommunications into the future. I saw Word Writer and Flash (hate Flash!) and I was set! So what else has Atari done for me? Nothing more really than produce a fun-to-use, inexpensive computer for my word processing and telecomm addiction. I didn't ask them for anything more. So, they decide to come out with an STe. I bought one and am head over heals for it. It's great! Do I ask them for anything else? No.

- Newsweek did a graph of the amount of personal computers on the
- market. Atari wasn't even in the top 10. Now...people say that
- Atari is good for them. Fine. But what happens when they fold?

People have been saying Atari is going to fold for years. What's different? They have new computers in the market. They have one of the largest base of computers in Europe. Their Portfolio is selling well. Their Lynx is doing well. They sell all the computers they make.

- They're down to 2 5/8. Quite a drop from last year's 14.

I know. OUCH!

- Atari STs may be good for you now....but think about what may come
- of them (and you) if they can't get their act together.

I thought the rule in the computer industry is to buy the computer that suits your needs now. Not to wait around for what happens in the future.

1449. Re: SuperCharger

Source record: 239069

```
- Has anyone received the new software update for SuperCharger yet?
- The newest version should be 1.40 . The reason I ask is because the
- newest version is supposed to be able to run IBM programs and Atari
- ST programs at the same time and because it should be shipping
- fairly soon.

I read in ST Report or ZNET that the software that accesses the
Supercharger from the ST is going to be a desk accessory. You can
have the IBM programs running on the Supercharger and ST programs
running on the ST. When you want to check on the IBM stuff, just
select it under the Desk menu and the terminal should come up. At
least that's what the guy said from Talon.
```

Can't get their act together? (Snort.)

Not a damned thing would happen. Nothing has happened in the last five
years of not having their act together. Nothing would happen now.

My ST is plugged into the power lines and the phone lines. It doesn't have
an umbilical cord running back to Uncle Jack. I doubt that the roof is
caving in at Atari Corp., but even if it did, the average Atari *owner*
wouldn't feel a thing. Nobody depends on Atari Corp. for software, and
except for the basic system unit (currently available for $250 on the used
market) everything is available from multiple third-party vendors. The
price of Atari stock is irrelevant.

1453. How much would a TT with Unix cost me (roughly)?

Newsgroup: comp.sys.atari.st
Date: 1990-08-27 03:46:48 UTC
From: bwhite@oucsace.cs.ohiou.edu
Message-ID: <1829@oucsace.cs.OHIOU.EDU>
Source record: 239073

I've seen a lot about the TT and I'm convinced I want one now.
I also want one with Unix; gnu is OK but frankly, I really hate gulam
and really want multitasking. So my question is,
- how much would the TT cost (realistically, i.e., including
discounts, etc.)
- how much does UNIX cost? (I can do the addition myself).
I'm hoping the whole bundle would cost under $3000. And no, I'm not
quite ready to shell out this much; I'm just dreaming.

One question: how easy would it be to hook up a TCP/IP line to
a TT?

ATARI SAFARI - - COMPUTER SHOW!

The newest from ATARI.
Demonstrations.
User groups.

SWAP MEET.

Saturday September 1, 1990
1:00 pm - 6:00 pm
Place: QUALITY INN.
Southwest Freeway (US-59) and Weslayan.
HOUSTON, TEXAS

****
** FREE Admission!!!!!! **
****

For information, contact: Bill Kithas, HACE president (713) 855-0815(home)
or 650-1994(office). Houston Atari computer user groups are sponsoring
the largest Atari computer show ever held in South Texas.

ATARI SAFARI '90 will feature the newest in Atari computers and software.
This show, to be held in southwest Houston, will offer demonstrations in
word processing, desktop publishing, MIDI music, computer graphics and games.

BOB BRODIE, of Atari Corporation, will demonstrate several of the newest
products: the STACY, a lap-top that can operate Macintosh software; the
PORTFOLIO, an MS-DOS hand held computer; the LYNX, a hand held color-screen
game game machine, and the STE, the newest in the full-size line of computers.
The STE features increased speed and enhanced graphics capabilities.

In addition to the demonstrations, the show will feature hardware and software
displays, and a SWAP MEET for used computers and related items.

Representatives from several computer groups will be available to help
people select a low-cost computer system for business, travel or home use.

The show, hosted by the HOUSTON ATARI COMPUTER ENTHUSIASTS, will begin at
1:00 pm on Saturday, September 1, at the Quality Inn on the Southwest Freeway
and Weslayan, just south of the Summit.

TABLE INFORMATION

User group information tables. Literature and sign up members. NO SALES,
no cost.

SALES tables for: User group; Vendors; Swap meet tables. $10.00 table
charge. Door prize donations may be substituted for table charge.

TABLE RESERVATION DEADLINE is AUGUST 30, 1990.
Make reservations by calling
(713) 988-3712.

NOTE: Originally the entry fee to ATARI SAFARI '90 was set at $2.00 in
order to cover the room costs. The room costs have since been
covered by DOUBLE CLICK SOFTWARE, which is located in Houston,
so entry is now FREE!!! Thanks go to DOUBLE CLICK.

From: dingelde@zgdvda.zgdvda.uucp
Message-ID: <2394@zgdvda.zgdvda.uucp>
Source record: 239076

Hello!
I've just received the last port of GNU EMACS V 18.55 from
com.binaries.atari.st/Volume 9. This editor requires the existence
of the file /etc/termcap with an entry for the used terminal,
that means here for the sm124. The Read_me file I received
says that there is a termcap-file included in the distribution
but it wasn't.
So can someone who works with that editor mail me the missing file or
tell me how to get this file ?

Source record: 239078

In article <802@pcsbst.pcs.com> jbe@sws4.pcs.com (John-Brown Evans) writes:
|This is a simple question for hackers, but it's the first time I'm
|trying to do this and don't want to waste a lot of time trying it out.
|
|I'm writing a program in C using AES and VDI calls. The prog produces
|graphics. I need to take a part of this (a box with contents) and send
|it to a printer (EPSON), to specific xy-coords. I have a monochrome monitor.
|
|Can anyone send me some tips (a piece of code??) on the best way to do this.
|I havn't found a function which dumps a section of the screen to printer.
|
|I assume I have to do the following:
|
|1. switch printer to graphics mode
|
|2. query which pixels are set and which aren't
|
|3. send the info pixel-wise to the printer
|
|4. switch the printer back
|
|This seems a long and tedious way to do this.

It is. Besides you end up with a solution that is printer dependent.
But you're lucky; there _is_ a function that dumps a block of graphics
data to the printer (there are two in fact). Dependent on your Xbios
bindings they are called Scrdmp() (no parameters, Xbios 20 if I'm
correct; this dumps the current screen), and Prtblk() (one parameter,
Xbios 36 if I'm correct; this dumps a graphic block).
You would probably use Prtblk (Scrdmp is just Prtblk with a suitable
parameter); the long parameter is a pointer to a block with the
following data:

```
var meaning what Scrdmp() uses
------------ -------------------- --------------------
long blkprt Address of screen Ram ($44e v_bs_ad)
int offset (0)
int width screen width (calc from v_openvwk or neg linea)
int height screen height (calc from v_openvwk or neg linea)
int left (0)
int right (0)
int scrres resolution (0 low, 1 med, 2 high) ($44c sshiftmd)
int dstres printer res (0,1) (config)
long colpal Address of color palette ($ff8240)
int type printer type (0-3) (config)
```

int port (0=centronics, 1=rs232) (config)
long masks pointer to halftone masks (0)

(config: a parameter that is configurable and can be set using the Printer Setup DA. Perhaps there is a function that can get this information for you, I didn't check).

Since you want to use an arbitrary sized block of the screen, you need to copy it first to a spare area of ram using the blit functions (I think it is called vro_cpyfrm; you also have to set up the MFDB of the destination to reflect the correct block sizes). Then you can go ahead using Prtblk() (with blkprt pointing to the spare area). Maybe you could alternatively use offset, left and right; my documentation doesn't give any pointers as to what they are used for.

I hope this helps; tell me if you need any more info.

Leo.

Shouldn't be much of a chore if they have a workable Ethernet connection
for the beast. I've heard some talk of TCP/IP being developed for the
ST by some third party. It probably would be a trivial task to port it
to a 68030 ST.

Of course, the answer could have been shortened to "I don't know. Atari hasn't released the TT in any user-purchasable format at this time." All other (useless to the question) speculation wasn't worth the bandwidth.

Here in Canada,there appears to have been NO official recognition of
the problem. My complaints were tested by my local tech after installing
TOS 1.4 from the desktop only,so the problem wasn't found. Unfortunately
other programs using their own file selectors don't benefit from TOS 1.4s
fmc hack. A friendly dealers solution was to swap in a drive from a machine
going back to Atari for other problems (I'll never tell who).
Perhaps Bob Brodie,who has showed up here a few times from an account on
portal could clarify what's going onm.

There is Ethernet box for ST (made in Germany). The price in Finland is about 5000 Fim. ~ $1100. It is connected to ST's DMA port.

Hi All!

I've put two ST demos (they work on the STE as well) in the atari/new
directory at atari.archive.

They are:

amigajok.arc AN Cool's Amiga Joke Demo (needs 1 meg)
acid2.arc AN Cool's Acid Burn 2 Demo

They're both worth a look. Hopefully, they'll be moved into atari/demos
when the guys at terminator find some spare time.

BTW, does anyone know where I could get a copy of SPUFILE? I'd like to
put some full-disk demos on terminator.

If you've got any good demos, please put them on terminator!

Cheers,
Mark.

And I don't know what your source of information is, but drop it :-)
The TT can be bought! I know a company which runs Smalltalk80 on it
(138% Dorado for the curious). Right now it will be sold to developers
and very anoying customers :-) Look for them before christmas.

>2> Atari Unix is in the same type of limbo that TOS 1.4 was in say

> to sell it in the US.

I saw a stable version of System V somewhat... at the Atari show in
Duesseldorf last weekend. They will port some newer software before spring
and it will cost below 10000DM then. (right now this is about US$6400
in Europe and if the $ continues falling then it will be 8000 in spring, hehe)

Ah, talking about the TT.... it sucks!
According to specifications it should run at 32Mhz. Actually it houses
a 68030xxx33 chip as I found by opening one (which is even more difficult
than on the ST. Lots of shieldings and lots of screws. One screw holds
the harddisk and when we removed it the disk dropped on the desk, oops :-)
However, it is only slightly faster than a Mac II somewhat at 16Mhz
which is rather disappointing (even then the TT is a reasonably priced
machine comparing it to the price of Macs in Germay). I guess the other
hardware was designed for 16Mhz only and cannot keep the pace.
(rams are 100ns for instance)

Andreas Toenne
atoenne@unido.uucp

P.S. These are my humble opinions based on 3 days experience and a set of screwdrivers. I am not payed by Atari (they never will) neither by one of their competitors.

The NEC 3D is well worth getting - it gives an excellent picture in both
monochrome and colour modes and the picture can be set to any size
that you want it to be.

Be warned that the 2A will not work properly on the ST - it is designed
exclusively for VGA cards - and cannot sync at the right frequencies for
the ST.

Anyone know how to create the cable to hook a multisync to an ST?
Doesn't seem like it would be that difficult to make if I knew what
went where...a few local places will make them, but they want (what
I consider) an arm and a leg.

>Be warned that the 2A will not work properly on the ST - it is designed

Also, how can you tell which multisyncs will work with the ST?
Is it any multisync that will do ega, cga and vga?

Has anyone been able to use MX2 with an STe or even TOS 1.4? When I try to use one of the commands (IP, BP, FP) I get 12 bombs.

Thanks.

1470. Re: how about we stop the war before it starts?

Newsgroup: comp.sys.atari.st
Date: 1990-08-28 00:08:52 UTC
From: rg@sisd.kodak.com
Message-ID: <1990Aug28.000852.27805@sisd.kodak.com>
Source record: 239090

The point in which I'm attempting to get to we computer nuts is not another "lets compare machines" (this always starts a range war and I'll shortly explain why...). My point here is sheer credibility. I certainly would not buy another car from a dealer that made promises, then, never delivers. The ST is STILL a great machine, no if ands or maybes. I assisted in coding Deskcart!, and wrote Print-It!. Deskcart was highly touted. The earnings were sad. Print-It! was on pirate BBS's before release. Now... to the nitty gritty First, take a look at the PC areas... No arguing about "I'm best... not you". NO! consumer likes to admit, "I made a purchase mistake"... Or, for some reason, we think our computer as an intricate member of our houshold/life. A parallel might be... The next door neighbor's 300zx swallows my Supra and chews it apart. Then, theres the guy w/ the Hyundai, who, thinks both are whacko. These, in computerdom are the IBM'rs. I've worked w/ PC's from Model 1 Trs-80's to Apples & atari's and MUCH more. Judge machines by support/usefulness/future usefulness, not by the name/religion.
My personal opinion is simply the PC offers everyone a steady growing highly supported platform to allow computers to aid them in their lives....

....
> Sigh! Those were the days. I wanted a ZX81, but couldn't afford one, so I had
> to stick to my ZX80.

Actually I used an assembler for it, you read the assembler in from cassette
and it was a large basic program, since cassette didn't make for a robust
file system there was no way to build an "object" so you entered the
assembly statements in REM statements at the top of the program (the assembler!)
then run the assembler. The resulting machine code would be org'd to some spot
in memory, my friend an I were using it to do vector graphics via DAC's to a scope.

The cassette was unreliable at best. Why didn't the ST come with a cassette port? :-)

1472. Tempus II and TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1990-08-28 03:12:06 UTC
From: os9paul@gkcl.ists.ca
Message-ID: <11895@ists.ists.ca>
Source record: 239091

I have just upgraded to TOS 1.4 and I noticed a minor problem/annoyance with Tempus II. The contents of the scroll bar in the file selector are shifted to the left. If I click on the slider, the red dotted box that indicates the moved slider is in the proper location. So far, everything else in Tempus appears to be OK.

Has anyone else seen this? Is there a patch available?

Tech stuff: Tempus II version 2.07; AUTO folder contains POOLFIX3 and FOLDR100.PRG.

Message-ID: <1990Aug28.045821.29561@ecst.csuchico.edu>
Source record: 239097

- BTW, does anyone know where I could get a copy of SPUFILE? I'd like
- to put some full-disk demos on terminator.

I've never heard of SPUFILE. I've used Magic Shadow Archiver for sending disks as files. There's also Ultra and Chaos Disk Compacter, but I don't use them.

- If you've got any good demos, please put them on terminator!

I have a few full-disk demos I could upload to terminator, like Snowman, Whattaheck, and the TNT-FNIL demo. I have a few others, like the Union and the Carebears Cuddly Demos, but I don't think I can save them as a file. I've already uploaded a couple of STe demos that I was surprised weren't up there already.

1475. Problems with gnuemacs v18-55 for ST

Newsgroup: comp.sys.atari.st
Date: 1990-08-28 07:18:20 UTC
From: aa@lln-cs.UUCP
Message-ID: <998@lln-cs.UUCP>
Source record: 239001

I tried to install gnuemacs v18.55 posted some months ago in
comp.binaries.atari.st on my ST (2Mb), but I still have some problems:

1) Shell problem:

When I press the <Return> key in a shell-mode buffer (*Shell*), I
always get the following message:

%: not found
cmd exit code -33

although my ESHELL env-var has the value "c:\gnu\gulam405\gulam.prg".
(I have a copy of gulam under "c:\bin\sh" too)
If I replace the "(insert "\n% ")" line of shell.el by "(insert "\n ")",
commands seem to be sent to the shell but the results dont go into the *Shell*
buffer. This append whatever the value of ESHELL is (!?). By the way,
shell-command work fine.
What must I do to get it work (like what I'm used under Unix) ?

2) Keyboard and mouse problem:

The function keys and the keypad keys return key codes such as
"#0", "#1" ... The mouse left and right buttons return "#l" and "#r"
respectively... It seems to me that they should return "ESC-#l" and "ESC-#r"
because when I press the "ESC" key before pressing the mouse button gnuemacs
does what I expected. Any solution ?

1476. 8-bit digital audio

Newsgroup: comp.sys.atari.st
Date: 1990-08-28 07:39:15 UTC
From: ao@lne.kth.se
Message-ID: <0093BDD2.3E210680@lne.kth.se>
Source record: 239093

Hi there!

Could anyone tell me what format the ST uses to create
8-bit audio files. I own an IBM PC/AT and have tried
Richard E. Zobell's "REplay", which plays ST audio
files on the PC-speaker.

I have a couple of 12-bit PCM files which I would like
to convert to ST-format so that I can play them on my
IBM PC/AT.

I suspect that it is some kind of ADPCM format, but I
need the algorithm.

Thanks in advance,

Anders Ohlsson

1477. Arcgsh 3.1

Newsgroup: comp.sys.atari.st
Date: 1990-08-28 08:03:46 UTC
From: klute@heike.informatik.uni-dortmund.de
Message-ID: <1990Aug28.100346@heike.informatik.uni-dortmund.de>
Source record: 239096

I just submitted Arcgsh 3.1 to comp.binaries.atari.st. It contains a few minor and one major fix: The parameter string to the user-defined editor and the user-defined pager was restricted to 32 bytes, which caused problems when one wanted to edit or to look at files deep down in the file hierarchy. This has been fixed.

Thanks to Roland Schreier (schreier%eaecl1@tuvie.uucp) who drew my attention to that bug.

>(rams are 100ns for instance)

At present the system as sold to developers is an 8Meg machine with 33Mzh CPU but clocked at 16Mhz. The final release version will be clocked at 32Mhz. I am not sure if this will involve the whole machine running at 33Mhz or if a cache method similar to HyperCache or Turbo16 on the ST will be used. Either way the performance increase should be significant.

The ST has a PD package that uses tcp/ip the KA9Q package it is on
terminator with sources. Porting this to use a VME ethernet or SCSI
eternet card connected to the TT should not be to hard. NB: the ST
version uses serial ip (SLIP).

>experience you have had with dead monitors.

Well I guess this as good a time as any to voice my sorrows too.
We have two SM124 monitors here with the same problem. We have carefully checked them against working ones and it looks like the line output transformers are dead. We have been waiting for months for a local Atari dealer to get us replacements but nothing has turned up yet. The dealer has quite a few SM124s waiting for repair and says he can't get the LOPTs for them. However he can get LOPT's for SM125's (The Tilt 'n Swivel monitor) but they are no use to SM124's.

Unless we can get our hands on SM124 LOPT's we might have to buy new monitors and I don't want to get SM124's if I can't repair them. SM125's seem not to be on sale any more.

BTW SM124's are made for Atari by Goldstar. Anyone know if they will supply the parts?

gatekeeper.dec.com: pub/misc/stdwin.

I played with this a long time ago... the biggest non-portable thing
it did was pass structures by value into AES calls instead of passing
the individual arguments. This is something Lattice(?) allows and
Laser C doesn't. I also found that declaring the WIN *'s as register
WIN * when they're passed into routines reduced the code size by
10%... ah, for an optimizing compiler.

1495. Re: showdvi fonts?

Newsgroup: comp.sys.atari.st
Date: 1990-08-29 06:38:35 UTC
From: dinolt@wdl1.wdl.fac.com
Message-ID: <1100002@wdl1.wdl.fac.com>
Source record: 239017

```
This is really a note from Jeff Long (longj@LONEX.RADC.AF.MIL). He
asked me to post it for him. Comments, etc. should be addressed
directly to him. (dinolt@wdl1.wdl.fac.com)
--------------------------------------------------------------------------

A while back someone posted a note asking for help getting SHOWDVI to load
the fonts it needs. I have spent a couple of days getting my show/print
dvi set-up and working with my monochrome system and 30 meg drive and
HP-DeskJet printer.
I took 1.5 Meg of PK fonts from my Sun at work and d/led them and
then moved them into single fonts files using FLIB.TTP (which came with
the showdvi distribution I got from Terminator). I still use the same
fontlib for the screen that was included in the file showdvifnt.zoo, but
that zoo file had only enough fonts for the screen driver, not any 300dpi
fonts for my deskjet.
Anyway, the point of this is to present my general findings on using
show/printdvi. I have the fontlibs in a directory like I:\fonts\screen
and I:\fonts\printer and each of these folders has the fontfiles for the
resolutions needed. I believe the screen directory has PK0083 thru
PK0144 in single magsteps. My printer directory has a very complete
collection of 300dpi fonts from PK0300 to PK0622.
I boot show/printdvi from the root level of my F: drive (using
Neodesk :-)) and have the showdvi.fnt and printdvi.fnt files located on C:
drive in a folder labeled C:\CONFIG\. The two font config files are just
modified versions of ones that came with the distributions.
They look like this:
; the fonts for the ATARI SM 124
flib 100 I:\fonts\screen ;magstep 0
flib 110 I:\fonts\screen ;magstep half
flib 120 I:\fonts\screen ;magstep 1
flib 144 I:\fonts\screen ;magstep 2
flib 173 I:\fonts\screen ;magstep 3
flib 207 I:\fonts\screen ;magstep 4
flib 249 I:\fonts\screen ;magstep 5
; now the fonts for the HP-DESKJET
flib 300 I:\fonts\printer ;magstep 0
flib 329 I:\fonts\printer ;magstep half
flib 360 I:\fonts\printer ;magstep 1
flib 432 I:\fonts\printer ;magstep 2
flib 518 I:\fonts\printer ;magstep 3
flib 622 I:\fonts\printer ;magstep 4
flib 746 I:\fonts\printer ;magstep 5
; now single fonts
pk_str %d\%s
```

;--------end of config file-----------

NOTICE: I had to CHANGE THE LAST LINE to read as shown!! It originally
was different (I don't remember exactly how), and I couldn't get either
program to locate my individual pk fontfiles when they were located as separate
font files. Before I moved all the fonts into fontlibs, I had each
pk file in folders like:
I:\fonts\tex\fonts\300\cmr10 (where "cmr10" was the individual pk file)
and with the last line of the config file changed to read as shown, it
could locate the files.

I would strongly recommend working from fontlibs, as it keeps your
directory tree much cleaner! As a service, I would be willing to provide
copies of my 300 dpi fontlibs to someone if they send me 3 ds/dd disks in
a mailer that I can use to return them in, along with $2.00 to cover the
return postage. Like I said, the printer fontlibs amount to a little over
1.5 Meg, so I don't think it is practical to post them to the net!!

By the way, about a year ago, I posted a port of BibTeX for the ST to the
net. I would appreciate it if anyone who has used it could at least give
me feedback on how it is working for them!
My new net address is:
longj@lonex.radc.af.mil
and if anyone wants the fonts, mail the disks and stuff to me at:
Jeff Long

>
> Suggestions are also appreciated. Is there a good test program for
> this problem?

I'm not sure about the current state of Chinon drives on the Mega, but the external floppy drive I bought recently had the 'media change' problem. It was sold by a large UK distributor, Evesham Micros, and I don't know how widespread it is elsewhere in the world, but it's made by a firm called Roctec and it's called something like RF 302. It's advertised as having a Teac or Citizen mechanism - I guess it depends on the batch. Anyway, it's now back with Evesham with a request for replacement.

The easiest way I found to test the existence of the problem is this:

1. Insert disk #1. Open any folder

2. Remove disk #1 and insert disk #2. You'll still see the drive window displaying disk #1's folder. This is normal.

3. Click on the top left corner of the window (the 'close box') to return to the top directory.

A fully-working drive will proceed to read the disk, recognising that the media 'might have changed' and will then show the top directory of disk #2. A faulty drive not read the new disk and will show the top directory of disk #1.

You can force the ST to read the new disk in a faulty drive by pressing 'escape' (at least, this works on TOS 1.4 and above; I'm not sure if it works for all TOS versions). The fault is easy to spot if you're at the desktop, but might not be so easy if you're writing to a disk when inside an application. There's a considerable danger that you'll mess up the file allocation table on the 'new' disk, as the ST will think it's writing to the free space on the 'old' disk. The only mitigating factor is that if you had to swap disks because there was not enough free space on the old disk, the ST won't overwrite the new disk because

it will still think there's not enough free space.

Graham.

>official solutions that were made available.

I worked up a fix for the problem mechs at the time when Cumana was using them. I wrote to Cumana describing the problem and my fix; I got a letter back saying they'd discussed it with Chinon and my fix was 'suitable and appropriate'. Don't know if the publicised it. IF you are comfortable with taking your ST apart, what you do is:

Remove the drive mech. Looking into it, you'll see there are 2 little pin switches, one of which is located where the write-protect hole in the disk is, and a second right next to it. The first is the write-protect sense switch; the second is a 'disk present' switch. The internal circuitry of the Chinon drive means that the WP switch state doesn't get sent to the ST unless the disk present switch is closed.

The 'fix' is to make the disk-present switch be permanently closed. The way to do this is to solder a small jumper wire across its terminals on the bottom of the drives PC board. In my drive, both switches were in a single unit, but it was obvious which set of terminals went to which side.

NOTE --- I don't know if all Chinon drives with the problem are constructed the same way, so neither I nor anyone else I've mentioned can be held responsible if you try this and it breaks things. All I will commit to is that it worked fine for me... I've fixed 2 Chinon mechs that way. (It's a good way to get a reliable CHEAP mech -- there are a lot of them flying around, presumably because people have discovered they don't work on STs. Unless you perform the trivial modification.)

ALSO NOTE -- Not all Chinon drives have the problem. In particular, Cumana claimed that they were going to switch to a different model of Chinon mech which worked properly in this regard.

>Suggestions are also appreciated. Is there a good test program for
>this problem? Please try to reply to me directly and I'll summarize
>if anyone else is in the same boat, and interested.

There's a simple test _procedure_. Put a write-enabled floppy (little window closed) in the drive, and pop up a directory-listing window. Take the floppy out, reinsert it (or any other write-enabled floppy) and hit ESCape. If the drive spins, you're OK. If the drive does not spin, you've got the problem. The problem mechs only do the wrong thing with write-enabled disks. To be sure, try this several times .

1499. TOS 1.4 >> How many chips for a STfm?

Newsgroup: comp.sys.atari.st
Date: 1990-08-29 15:49:23 UTC
From: swood@vela.acs.oakland.edu
Message-ID: <2777@vela.acs.oakland.edu>
Source record: 239016

I am considering a TOS upgrade, and have not had the gumption to tear open my ST yet to see what it would entail. Before I go off calling the computer store or hooting up Atari on the land line, is there any one that has upgraded their STfm that could tell me what I need? Who knows, maybe I could even buy one of the nice chip sets that have been for-sale on the net! I would also be interested in what soldering (if any) is required.

Are you sure ? really sure ?

If this is true, Atari Germany will have tons of problems. They sold those machines as 32Mhz *CLOCK SPEED*. Now all developers are pissed.
What is the use of a development machine if it runs only at 1/2 of the speed of the regular ones ? You cannot do performance tests, timing adjustments etc.

1503. More files sent to atari.archive

Newsgroup: comp.sys.atari.st
Date: 1990-08-29 22:12:57 UTC
From: ekrimen@csuchico.edu
Message-ID: <1990Aug29.221257.11967@ecst.csuchico.edu>
Source record: 239024

I have just sent these files to atari.archive.

foldrsrt.lzh - Folder resorter. Good for AUTO folder.
lostboys.lzh - Lost Boys Definitive Demo.
sbt6pach.lzh - Patch to fix upper/lowercase bug in SuperBoot 6.0
spaceace.lzh - The famous Space Ace demo. (There's one already there
from 1986 (???), ACEDEMO.ARC but it's nothing like
this one. You need Magic Shadow Archiver to extract
the file to disk once you unLZH it. I think the
filename on atari.archive is SHADOW.ARC in /utilities.
suprbt60.lzh - SuperBoot version 6.0.
deskmg31.lzh - A utility like SuperBoot, but SuperBoot seems to be
of more use to hard drive owners and DeskManager seems
easier for floppy users.

BTW, I haven't seen that Jon (weiner@atari.archive.umich.edu??) has
moved the other ones that I've sent, over to their proper directories.
I guess everyone must wait until he does so.

1504. Help with game DGDB wanted

Newsgroup: comp.sys.atari.st
Date: 1990-08-29 23:07:37 UTC
From: 7103_3654@uwovax.uwo.ca
Message-ID: <6834.26dc127a@uwovax.uwo.ca>
Source record: 239023

Hi! Recently I collected a game called "DGDB" from the archive site Terminator. Though the game starts up OK, I cna't get the little man on the screen to respond to anything that I do with my joystick. Is there someone out there who has gotten the game to work for them? Were you using TOS 1.0 or higher? If you got it to work with a version of TOS higher that 1.0, was there a trick to getting the man to move?

Thanx to anyone who can help.

Adele

1505. More sent to atari.archive

Newsgroup: comp.sys.atari.st
Date: 1990-08-30 00:44:15 UTC
From: ekrimen@csuchico.edu
Message-ID: <1990Aug30.004415.13774@ecst.csuchico.edu>
Source record: 239038

These were just sent to atari.archive.

st_conn.lzh - ST Connexion Sound Demo. Uses SoundTracker modules.
Sooner or later I'll upload a program that plays these
modules in stereo for the STe. It doesn't have the
nice display that this demo has, however.

cybscape.lzh - Demo from Antic, showing one result of the use of
their programs, Cyber Control, CAD 3-D, Cyber Paint,
etc. This one's pretty good, despite my lame
description. :^)

I sure hope I'm not overwhelming this place. It's just that once my
BBS and school gets going, I don't know how much time I'll have to
send stuff like this. Hopefully, these and the other files are moved
over to /demos soon; each time I send a batch, I check and nothing new
is there. I have about fifteen disks of archived demos and I've only
gone through number four. :^)

1506. DC-Showit problems

Keep 'em coming if you can. }-) I've been trying them out, and I think Jeff has moved 'em over every time he logs in.

General comments on recently uploaded demos....

genesis.tos bombs on my machine. Dunno why, haven't looked at it. Suspect TOS 1.4 incompatibility. The acid2.arc file is 360K in size, the single file within it is only 279K. Kind of a drag, that. The Space Ace demo is kind of cool, but the graphics aren't running in lock-step synchronization with the digitized sound. On my Turbo-16 equipped Mega 4, the animation sequence ends before the sound track should end, so the sound gets cut off abruptly. (And the laser blast sound effects don't occur when the shots are drawn onscreen. Just like watching a Japanese movie, but ... }-)
The color demo also doesn't work, due to Turbo-16, but that's no surprise. Most of the others have been OK. I haven't gotten the snowman demo to work yet, it crashes my system every try so far. (And it's awful good at wiping the FAT and root dir of my RAM disk every time, too. Quite tedious...)

Usually pretty fun stuff here, tho. Nice. Finalcut was pretty good.

Hmmm, well there is one place that sells 85Mb Seagate drive for about #300
(not including VAT) so I would imagine a price of about #250 or less for a
60Mb SCSI drive. 'Fraid I don't know prices for non-Seagate drives as
nobody advertises them...

1512. Re: Using a mainframe to run gcc for atari

Newsgroup: comp.sys.atari.st
Date: 1990-08-30 13:18:07 UTC
From: kentd@FtCollins.NCR.com
Message-ID: <KENTD.90Aug30141807@zappa.FtCollins.NCR.com>
Source record: 239029

FWIW, I know of someone who took the sources to Sozobon C and coerced
them into running on a VAX/VMS system... The output was a .prg file
suitable for execution on an ST. So, I would assume that gcc could be
used to produce ST executables (probably with a little "massaging" of the gcc
code on your part. :^)

I _love_ software that comes with source code.

I read in the Guardian (UK) Computer section today that the "Atari TT030"
is on sale *now* in the UK and Germany.

UK price (2meg RAM, 40meg HD, colour monitor) L1990 + VAT
32 MHz processor (different, the article says, from developers versions
which are apparrently 16 MHz)

The article goes on to say that the Unix has been delayed another 6 months
due to a new Unix (AT&T SysV.4 instead of V.3), being ported by
a UK company (called Root or somesuch) . New window manager
(from some French Company - never heard of it before IXI's X.Desktop would
be a better move IMHO)
...and...
a switch to using the GNU compiler gcc (Hurray !! Rah!)

(text cut...)

As for the Atari ST's, no way. Don't you think there are enough different platforms on campus to try to support without adding another one? vms, unix, ms-dos, windows, ultrix, primos, AT's, Pc's, macintosh, minix (unsupported), multics (anyone remember this?), 386's, etc.

Mr. Parker is very fond of the Amiga. This platform is at least a technologically superior product to either a pc or a mac, and given the right parts could function as either one. (so much for software support problems -- it could run it). The only thing I have a problem with is the fact that the major software firms do not have software available for it -- though they claim to be working on it.

In the case of the Atari ST, I haven't seen any claims for either software or hardware compatibility (bad word, but) even in the distant future.

I guess what I'm trying to get at is that if another type of platform is going to be considered, lets get one capable of adapting to our needs. The Amiga with it's X Windows support, tcp/ip support, NTSC video capability, and Unix capability would be a much better platform then the Atari.

-seg

p.s. maybe I should cross-post to ou.flame?

>>> end of post <<<

thanks guys!

swood

>> - how much does UNIX cost? (I can do the addition myself).
>>I'm hoping the whole bundle would cost under $3000. And no, I'm not
>>quite ready to shell out this much; I'm just dreaming.

Today's copy of the Guardian (a UK newspaper) says the TT was shown at last week's Dusseldorf Atari show. Atari apparently claimed the TT was available NOW in the UK and Germany, but of course no one will believe it until they actually see one. The article repeated a price I've seen before of 1990 UK pounds for a 2MB TT with 40MB disc and colour monitor, but said it definitely had a 32MHz 68030, the 16MHz version had only been sold to developers.

We await a definitive sighting.

News on UNIX timescales is not good. Atari have decided to scrap System V.3 and go for V.4. Unisoft are doing the port and it's scheduled for next year. They've also decided to go for shipping GNU C. The X desktop will be Motif-based and will be provided by a French company. (How much of this do you believe?)

Also "announced" were a low-cost laser printer and thick and thin Ethernet connections and networking for Mega STs (called Atarinet).

P.S. the new quarterly ST World has finally appeared in the UK. IMHO it's good and well worth 3 quid (but where's the free disc :-)

Several things you should look for and be certain of:

1) DC SHOWIT _must_ run after GDOS or G+PLUS or AMCGDOS in the AUTO folder. Get one of the PD folder sorters to be certain. To reorganize your folder by hand:
a) Copy everything from your AUTO folder to another folder.
b) Delete your AUTO folder.
c) Create a new AUTO folder.
d) Copy the files into the new AUTO folder _one at a time_ in the order you want them to execute

2) If you are using Quick ST prior to version 2.0, you'll have problems. Come to think of it, I don't know if the hooks are in for 2.0. If not, the next release will hook into Quick ST 2.xx

3) If you are using Turbo ST 1.8 or greater, you'll have problems. Turbo ST 1.6 will work just fine. Talk to SofTrek to get versin 1.82d which is specially

designed for DC Desktop, but will also work with DC SHOWIT.

No set date for release of DC SHOWIT 1.2, but be patient, I have done some code rewriting.

If the machine going to developers, is the final machine why the delay
in shipping? Perhaps german developers have got the 32Mhz machine but
if what you say is correct then the HW mod is juct like the JOTO
accelerater for the ST and does not offer that much exta performance.
I hope not :-(

I have metafont, as well as a complete set of *.mf files for
generating every font you can imagine. I takes about 10-15 minutes to
generate one font on the ST, compared to about 30 seconds on the
SPARCstation 1 at work, so I don't think I'll use it a whole lot.

I got it from panarthea, I think. I may have gotten it from ruu
(mail-server@cs.ruu.nl) and I know that my *.mf set wasn't complete,
so I had to hunt down a few files at others places. I'm willing to
send it all to you if you don't want to hunt down all the pieces yourself.

>

One of the changes in TOS 1.4 is it now forces a re-read of the disk whenever you hit ESCape, even if a media change was not detected. This, unfortunatly, will not fix the problem if you change disks while inside of a program. It does make it much more difficult to tell if you have this problem. The procedure outlined above will work from Neodesk, since it does not force the re-read.

Aw Fuck - PLEASE DON'T!!!!!

ya hear me,

D O N ` T!!

Anyone who know him personally, tell him not to do so!! The version I sent
to John some weeks ago is still buggy.

I've had a phone talk with Adrian Ashley yesterday, and we decided that
it would be a good idea if I send him Version 1.15 (newest one).

If one of John, Adrian or Steve Yelvington has the possibility to call
germany without having to pay the charge (say, from their offices? :-)
just gimme a call, so we can transmit the stuff via phoneline.

Hope to get things right.

>
>Paul Watson
>peewee@ucscb.ucsc.edu

If you have a good enough compiler on your Vax or Sun, no problem. That's
how I compile most large programs for my ST these days. (I used a NeXT box
produce the executables for Fractint while I was porting it. I also used
it to produce my ST-Minix upgrade kit. Very handy.)

Specifically, you will need to transfer the source for the compiler,
assembler, and linker to your "mainframe" system, and you will also need
all the header files and library source code. After you compile the utilities,
you will need to compile the library using the ST header files, then you'll
be ready to produce ST executable files. Anyway, the gcc stuff from Jwahar
Bammi is already set up to allow creating this cross-development system, and
it works pretty well.

1531. help! I'm in s-l-o-w m--o--t--i--o--n!

Newsgroup: comp.sys.atari.st
Date: 1990-08-30 22:18:03 UTC
From: cs63bld@unccvax.uncc.edu
Message-ID: <2648@unccvax.uncc.edu>
Source record: 239047

I have a 20mb HD on my 1040st with an ICD SCSI adapter and a omti controller tying it all together. One of my partitions (10mb) is just about full, and write times to it are horrifying! We're talking a minimum of 7-10sec per file where the drive doesn't appear to be doing anything, then the red light will flash, and on to the next file. The mostly empty partition on the drive still responds just as fast as you would expect...
I thought it must be a fragementation-type problem, and lacking anything like the defraggers available for the PC, I backed up all my files to floppy with Turtle, restored them, and looked forward to a performace increase. Nope.

What's going on here? Any help would be appreciated.
Also, is there a PD program to complement Turtle? I mean something that restores to your HD and just prompts you for each disk. That would be a lot easier (and faster!) than copying them from the desktop....

Thanks in advance,
Brian Daniels
(cs63bld@unccvax.uucp)

Did you actually zero the partition or did you just delete the files? That's
all I can think of...

>What's going on here? Any help would be appreciated.
>Also, is there a PD program to complement Turtle? I mean something that
>restores to your HD and just prompts you for each disk. That would be a lot

My, my, aren't you in luck! There exists "UnTurtle," (named with permission
of George Woodside) which allows you to do restores semi-painlessly. You
pick a floppy drive to restore from and a partition to restore to...then
hit return. When all files are copied, insert the next disk and hit return.
UnTurtle handles all of the folder creation and so on.

UnTurtle is up to version 1.3 and I've been using it with no problems for
years. Version 2.0 is supposedly on the way (rewritten from Personal Pascal
to Laser C, and with a nicer user-interface), but the author has other, more
pressing projects to finish first.

In keeping with the Turtle idea, UnTurtle is freeware. If it isn't up on
Terminator, I'll post it tonight.

1533. single drive, .TTP woes...

Newsgroup: comp.sys.atari.st
Date: 1990-08-30 23:26:04 UTC
From: asedm@acad2.anc.alaska.edu
Message-ID: <1990Aug30.232604.18080@hayes.fai.alaska.edu>
Source record: 238909

I have only one floppy drive and have noticed that when a .TTP
file is invoked that expects a filename, giving it a B:\ ....
does not cause TOS(1.0 :-<) to ask me to swap disks.

this makes it hard to edit files without putting an editor on every disk.
is there a patch for this? if so where can I find it?

thanks in advance!

1534. STEDEMO sent to atari.archive

Newsgroup: comp.sys.atari.st
Date: 1990-08-31 01:11:05 UTC
From: ekrimen@csuchico.edu
Message-ID: <1990Aug31.011105.20693@ecst.csuchico.edu>
Source record: 239048

I've just uploaded STEDEMO.LZH to atari.archive. It's a stereo player for Soundtracker modules, with some modules included.

When I list /demo, my demos aren't there. If everyone's getting the stuff I'm sending, where are you getting them from? I get soemthing like '#.unreadable' when I list /new, BTW.

1535. Emacs 3.9

Newsgroup: comp.sys.atari.st
Date: 1990-08-31 01:15:19 UTC
From: bill@mwca.UUCP
Message-ID: <1697@mwca.UUCP>
Source record: 238913

Can someone point me to a copy of emacs 3.9 (not 3.10)? I'd like to use emacs from within a CLI (Quick Tools), but 3.10 is GEM based and keeps ringing the bell if you load it as emacs.tos - I've heard 3.9 is much less GEM oriented.

Please email offers to email me emacs (Wow! What alliteration!), or point me to it on terminator or panarthea (I didn't see it).

Thanks!!

This was a problem with TOS 1.0 and 1.2 that is fixed in TOS 1.4. Used
to be that the FAT was searched from the beginning every time a new cluster
was needed. The fuller your partition, the bigger the FAT and the slower
the write. Fix: Keep your partitions small or get TOS 1.4.

>Also, is there a PD program to complement Turtle? I mean something that

Try The Vault. It is easier to use and more flexible than Turtle and
comes with a companion restore program, The Key.

1538. TNT_FNIL demo creator sent

Newsgroup: comp.sys.atari.st
Date: 1990-08-31 05:49:01 UTC
From: ekrimen@csuchico.edu
Message-ID: <1990Aug31.054901.21664@ecst.csuchico.edu>
Source record: 239050

I've just sent the TNT FNIL demo creator to atari.archive. This works on the ST and STe. It takes a while to create the demo, but it's worth it -- at least I think so. If I remember correctly, it may take the good part of five to ten minutes. And don't forget to "pump up the volume!"

BTW, I've found that running normal ST digitized sound though the STe sounds best if the tone, or equivalent, is turned down on your stereo; it eliminates a lot of the static and hiss. This goes for the Soundtracker modules too. For the STe digitized sounds, you can turn the tone all the up and it'll sound fine -- no hiss at all.

>Dave Halliday.
>(D.C.Halliday@newcastle.ac.uk)

Remember that the 68030 has internal instruction and data caches (256 bytes each?) so it can do quite a bit without even looking at the memory. I don't know what the system speed wil be, but speeding up the 68030 would still do quite a bit for performance. The TT also supports burst mode transfers for filling that cache in the "TT-RAM" which isn't shared by the video and sound subsystems so it'll be able to perform fairly well.

As I understand it (if I'm wrong, send me _MAIL_ and I'll correct myself), the Amiga A3000 25MHz version still runs with a 16MHz memory system as well.

Have fun!

From: n8742883@unicorn.WWU.EDU
Message-ID: <1478@unicorn.WWU.EDU>
Source record: 238903

Thanks for all the answers on how to restore .lzh files back to their original state! I have downloaded the proper program from termi-- oops, atari@archive. Whatever. :)

Today I got my TOS 1.4 roms and have happily upgraded from TOS 1.0. (I'll have to see how much of my software is incompatible with 1.4 before I finalize my judgement on how good the buy was...)

The first thing I noticed was how fast screen graphics are! I know that TOS 1.0 had it's graphics routines written in compiled C; are TOS 1.4's graphics routines written in "pure" assembly or something? And does anyone have any stats on how much faster the graphics actually are compared to TOS 1.0? And how much of a difference speedwise are the disk access times (for both floppy and hard drives)? I have heard that these times have been increased as well.

Thanx in advance for the stats (if they exist),

>Would this work? has anyone done this before? And does anyone know for sure that
>I would be waisting my time...?

I've used GCC 1.37 (loaded of dsrgsun.ces.cwru.edu) as a cross compiler
hosted on a SUN4 running SunOS 4.0.1, no problem. The only problem was
an alignment problem in the tool "size", j.bammi sent me a pacth, I don't
know if the patch made it into the distribution (or when).

The size assumptions are OK for running on a SUN4 (or so it seems).
I compiled the doodle demo program, and the PCCTS compiler-compiler tool.
These worked straight out of the box. The only thing i don't think
I tried was floating point. As the SUN uses IEEE itself, it should be okay. I
haven't got the executables for the SUN anymore, so I can't check it..

>that, especially in STe demos in /ste. :^(

I'm sorry about the larger ARC size. Most of the STE demos I uploaded were already packed and de-pack at runtime. ARC justs stores files which it doesn't compress, the extra length is probably the ARC header.

I'll use lharc in future if it gives better performance.

Keep uploading the demos!!!!

1. S L O W was a real TOS 1.1 problem. TOS 1.4 fixed it.
The problem is in writing, and the wrong algorithms used in TOS1.1 to
access the FAT to find a block to write into.

2. There is a PD program called restore that quickly restores the disk from
a turtle backup. Works real good!

> sell one? Thanks in advance!

I've had recent problems with my mono monitor; there is a capacitor that has blown 3 times! The first two times, it was replaced with a close but not exact one meeting the specs; this last time, my nearby atari dealer (in kansas city one hour away) got the correct one from california. So far so good. In any case, the symptoms where a black screen; if you open up the case, if it is blown capacitor you might see a mess since my literally exploded; there was also a smell.

GOOD LUCK!!

> Does anyone have any information about getting Appletalk to work with
> Spectre GCR? The most recent update (2.65) came out last spring with

The german Distibutor "Fearn and Music" in Stuttgart has presented it's
Appletalk compatible Slotcard for the Mega ST. It is jacked in the MegaBus-
Connector and applies 2 Appletalk Connectors to the ST under Spectre.
On the Atari Trade in Duesseldorf they presented some Mac's and some ST's
beeing connected under Appletalk. Work's fine.
The price is 550 DM, which is about 300 Dollars. But I heard roumors, that
Dave Small himself has developed a Appletalk Emulation Card for his product.
He planned to come to the Atari Fair, but he didn't appear.

From article <4155@crash.cts.com>, by bradm@pro-grouch.cts.com (Brad Martin):
> A few months ago I saw a magazine add for an autotracing program that turned
> bitmaped images into (I believe) GEM objects. Has this program ever come out,
> or does anyone know of any programs that will do this?

There are 2 programs, which can do this for now. First there is PEGASUS,
which only works with bitmaps of 640x400 size. It does it's job perfectly
including all types of mod-tools, which are needed for this kind of work.
The second PRG is TMS Vektor, which runs also with larger bitmaps, but
